### 3-3. KPG-22/KPG-22A Description

**(PC programming interface cable: Option)**

The KPG-22/22A is required to interface the transceiver with the computer. It has a circuit in its D-sub connector (KPG-22: 25-pin, KPG-22A: 9-pin) case that converts the RS-232C logic level to the TTL level.

The KPG-22/22A connects the SP/MIC connector of the transceiver to the RS-232C serial port of the computer.

### 3-4. KCT-53U Description (USB adapter: Option)

The KCT-53U is a cable which connects the KPG-22A to a USB port on a computer.

### 3-5. FPU (Programming Software) Description

The FPU is the programming software for the transceiver supplied on a CD-ROM. This software runs under windows XP, Vista or 7 on a PC. The software on this disk allows a user to program the transceiver transceivers via Programming interface cable (KPG-22/22A).

### 3-6. Programming with PC

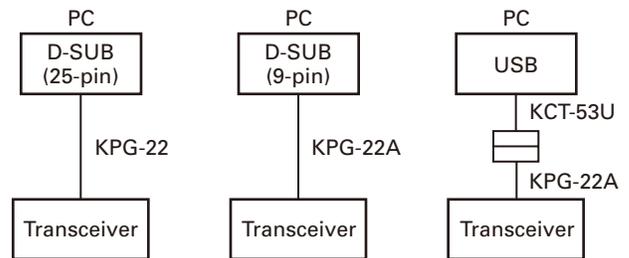

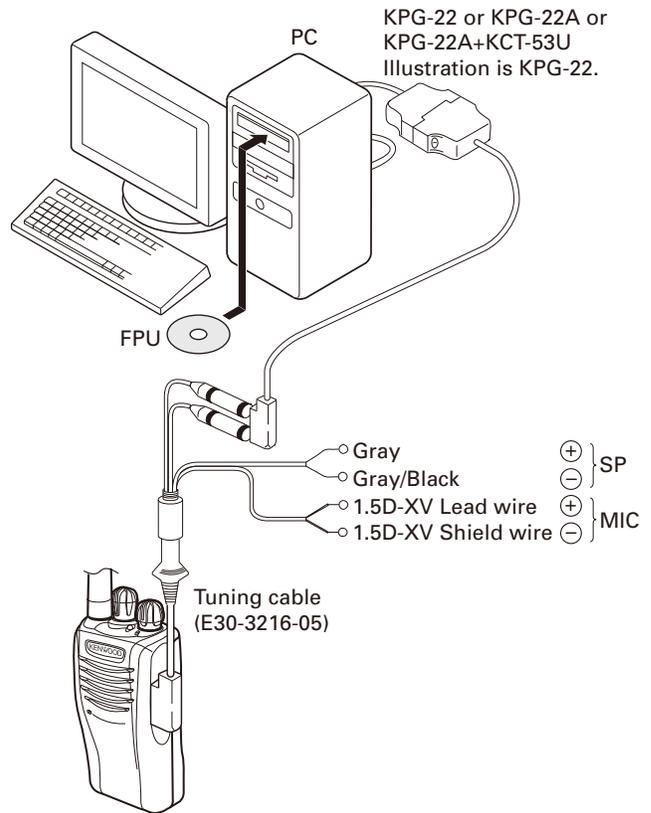

If data is transferred to the transceiver from a PC with the FPU, the data for each set can be modified.

# CIRCUIT DESCRIPTION

## 1. Overview

The TK-2360 is a VHF portable transceiver designed to operate in the frequency range of 136~174MHz. The unit consists of a receiver, transmitter, phase-locked loop (PLL) frequency synthesizer, base band parts, power supply and control circuits.

## 2. Frequency Configuration

The receiver utilizes double conversion. The first IF is 49.95MHz and the second IF is 450kHz. The first Local oscillator is supplied from the PLL circuit.

The PLL circuit in the transmitter generates the necessary frequencies.

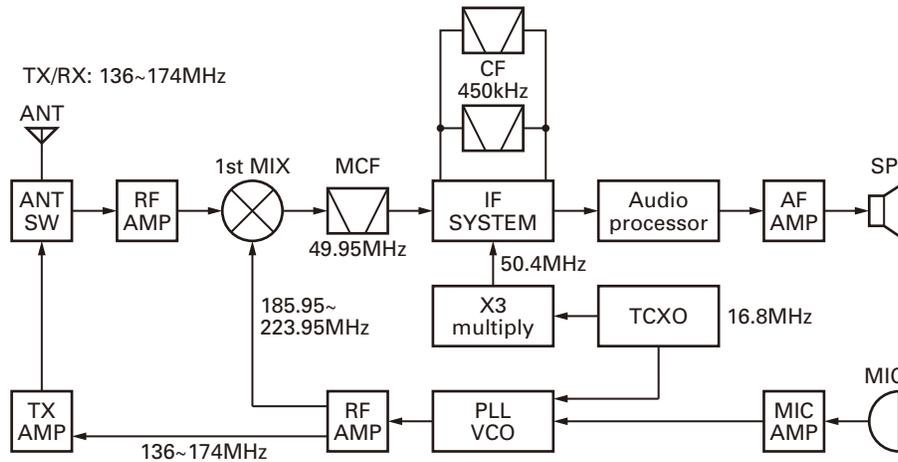

Fig. 1 Frequency configuration

## 3. Receiver System

The receiver system is shown in Figure 2.

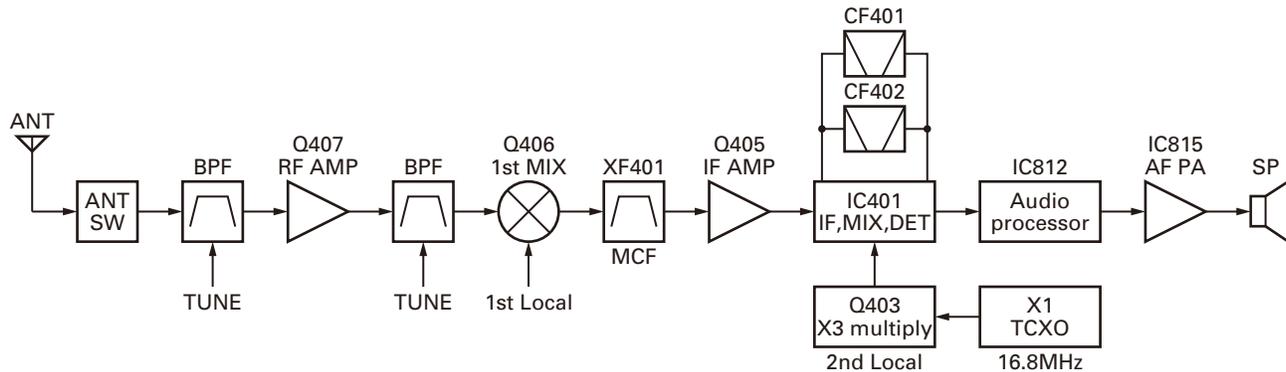

Fig. 2 Receiver system

### 3-1. Front End (RF Amplifier) Circuit

The signal coming from the antenna passes through the transmit/receive switching diode circuit (D201, D202, D203 and D204) and a BPF (L418 and L419), and is then amplified by the RF amplifier (Q407).

The resulting signal passes through a BPF (L414 and L416) and goes to the mixer. These BPFs are adjusted by variable capacitors (D404, D405, D407 and D408). The input voltage to the variable capacitor is a regulated voltage output from the DC amplifier (IC811).

### 3-2. First Mixer

The signal from the front end is mixed with the first local oscillator signal generated in the PLL circuit by Q406 to produce a first IF frequency of 49.95 MHz.

The resulting signal passes through the XF401 MCF to cut the adjacent spurious and provide the optimum characteristics, such as adjacent frequency selectivity.

## CIRCUIT DESCRIPTION

### 3-3. IF Amplifier Circuit

The first IF signal is passed through a four-pole monolithic crystal filter (XF401) to remove the adjacent channel signal. The filtered first IF signal is amplified by the first IF amplifier (Q405) and is then applied to the IF system IC (IC401).

The IF system IC provides a second mixer, limiting amplifier, quadrature detector and RSSI (Received Signal Strength Indicator). The second mixer mixes the first IF signal with the 50.4MHz signal of the second local oscillator output (Q403) and produces the second IF signal of 450kHz.

The second IF signal is passed through the ceramic filter (Wide: CF402, Narrow: CF401) to remove the adjacent channel signal. The filtered second IF signal is amplified by the limiting amplifier and demodulated by the quadrature detector with the ceramic discriminator (CD401). The demodulated signal is routed to the audio circuit.

### 3-4. Wide/Narrow Switching Circuit

Wide and Narrow settings can be made for each channel by switching the ceramic filters CF402 (Wide), CF401 (Narrow). The Wide and Narrow switching data is output from IC809.

D401 and D402 are switched to ceramic filters when a Wide/Narrow level is selected.

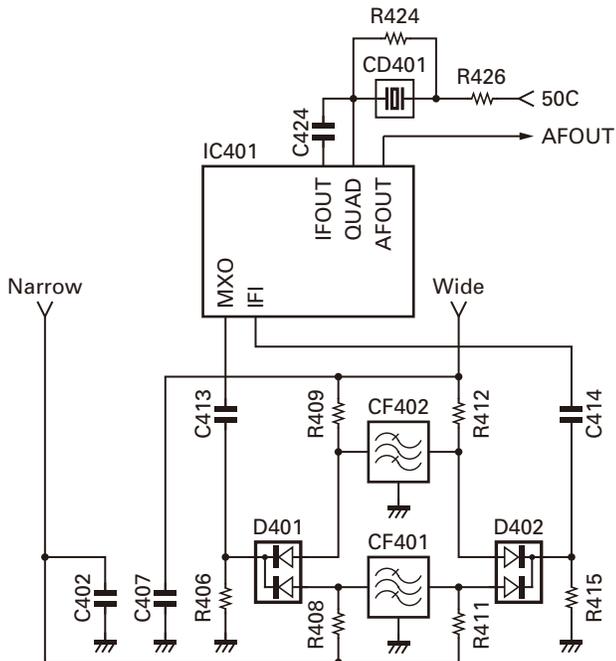

Fig. 3 Wide/Narrow switching circuit

### 3-5. Audio Amplifier Circuit

The demodulated signal from IC401 is sent to an AF amplifier through IC812, and is routed to an audio power amplifier (IC815) where it is amplified and output to the speaker.

### 3-6. Squelch Circuit

Part of the AF signal from the IC401 enters the FM IC (IC401) again, and the noise component is amplified and rectified by a filter and an amplifier to produce a DC voltage corresponding to the noise level.

The DC signal from the FM IC goes to the analog port of the MCU (IC809). IC809 determines whether or not to output sounds from the speaker by checking if the input voltage is higher or lower than the preset value.

To output sounds from the speaker, IC809 sends a high signal to the AFSW line and turns IC815 on through Q813, Q814, Q818 and Q819.

## 4. Transmitter System

### 4-1. Microphone Amplifier Circuit

The signal from the microphone is limited by the AGC circuit, which is composed of D807, 808, Q810, Q811 and the mute switch (Q809). IC812 is composed of a high-pass filter, low-pass filter and pre-emphasis/IDC circuit.

The signal from the microphone and the low speed data from the MCU (IC809) enter the Audio processor IC (IC812) and pass through each path and are mixed inside the IC.

The output signal from the audio processor goes to the VCO modulation input. The other output signal passes through the amplifier (IC3) and goes to the TCXO modulation input.

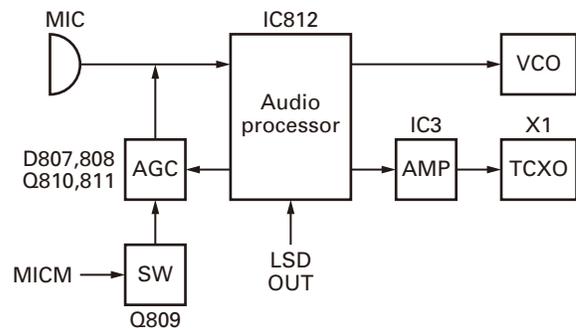

Fig. 4 Microphone amplifier circuit

## CIRCUIT DESCRIPTION

### 4-2. Driver and Final Amplifier Circuit

The signal from the T/R switch (D18 is on) is amplified by the RF AMP (Q201) and pre-drive amplifier (Q203) to 50mW.

The output of the pre-drive amplifier is amplified by the drive amplifier (Q204) and the RF final amplifier (Q205) to 5.0W (1W when the power is low).

The drive amplifier and the RF final amplifier consist of two MOS FET stages.

The output of the RF final amplifier is then passed through the harmonic filter (LPF) and antenna switch (D201 and D202) and is applied to the antenna terminal.

### 4-3. APC Circuit

The APC circuit always monitors the current flowing through the drive amplifier (Q204) and the RF power amplifier (Q205) and keeps a constant current. The voltage drop at R307, R309 and R310 is caused by the current flowing through the RF final amplifier. This voltage is applied to the differential amplifier IC301 (1/2).

IC301 (2/2) compares the output voltage of IC301 (1/2) with the reference voltage from IC811. The output of IC301 (2/2) controls the VG of the RF power amplifier and the drive amplifier to make both voltages the same.

The change of power high/low is carried out by the change of the reference voltage.

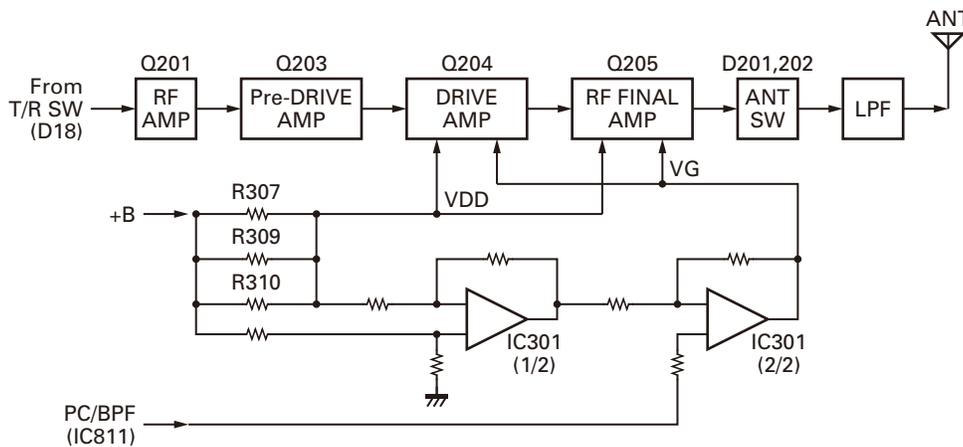

Fig. 5 Driver and final amplifier and APC circuit

## 5. Frequency Synthesizer Unit

### 5-1. Frequency synthesizer

The frequency synthesizer consists of the TCXO (X1), VCO, PLL-IC (IC1), and buffer amplifiers.

The TCXO generates 16.8MHz. The frequency stability is 1.5ppm within the temperature range of  $-30^{\circ}\text{C}$  to  $+60^{\circ}\text{C}$ . The frequency tuning and modulation of the TCXO are done to apply voltage to pin 1 of the TCXO. The output of the TCXO is applied to pin 10 of PLL-IC.

The VCO consists of 2 VCOs and covers a dual range of 185.95~223.95MHz for providing the first local signal for reception. The operating frequency is generated by Q5 in transmitting mode and Q4 in receiving mode. The oscillation frequency is controlled by applying the VCO control voltage, obtained from the phase comparator (IC1) to the variable capacitance diodes (D6, D7, D8, and D9 in transmitting mode and D3 and D5 in receiving mode)

The TX pin of IC809 goes "high" in transmitting mode,

causing Q7 and Q4 to turn off, and Q5 turn on. The TX pin goes "low" in receiving mode.

The output from Q4 and Q5 are amplified by a buffer amplifier (Q8) and Q2, and then sent to the PLL-IC.

The PLL-IC consists of a prescaler, reference divider, phase comparator, and charge pump. The input signal from pin 10 and 17 of the PLL-IC is divided down and compared at the phase comparator. The pulsed output signal of the phase comparator is applied to the charge pump and transformed into a DC signal in the loop filter (LPF). The DC signal is applied to the CV of the VCO and locked to keep the VCO frequency constant.

PLL data is output from PLLLE (pin 46), PLLCLK (pin 47), and PLLDAT (pin 45) of the MCU (IC809). The data is input to the PLL-IC when the channel is changed or transmission is changed to reception and vice versa. The PLL lock condition is always monitored by pin 48 (PLLLD) of the MCU. When the PLL is unlocked, PLLLD goes low.

## CIRCUIT DESCRIPTION

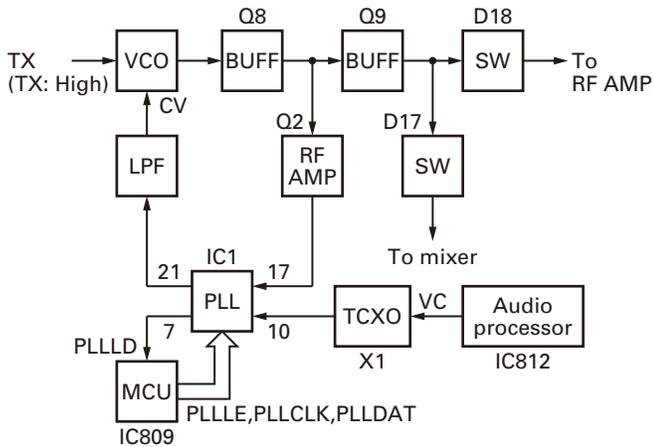

Fig. 6 PLL block diagram

### 6. Control Circuit

The control consists of the MCU (IC809) and its peripheral circuits. It controls the TX-RX unit. IC809 mainly performs the following;

- 1) Switching between transmission and reception by PTT signal input.
- 2) Reading channel information, frequency, and program data from the memory circuit.
- 3) Sending frequency program data to the PLL.
- 4) Controlling squelch on/off via the DC voltage from the squelch circuit.
- 5) Controlling the audio mute circuit via the decode data input.
- 6) Transmitting tone and encode data.

#### 6-1. Frequency Shift Circuit

The MCU (IC809) operates at a clock frequency of 12.0MHz. This oscillator has a circuit that shifts the frequency via Beat shift switch (Q806, Q807).

A beat sound may be able to be evaded from generation if "Beat Shift" is set to ON when it is generated in the internal spurious transmission modulated sound of the transceiver.

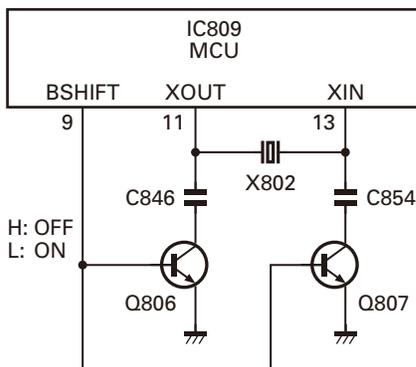

Fig. 7 Frequency shift circuit

#### 6-2. Memory Circuit

The Memory circuit consists of the MCU (IC809) and EEPROM (IC810). The EEPROM has a capacity of 64k bits and stores the channel information, the last channel data, the scan on status, and other parameters.

#### ■ EEPROM

##### Note:

The EEPROM stores tuning data (Deviation, Squelch, etc.).

Realign the transceiver after replacing the EEPROM.

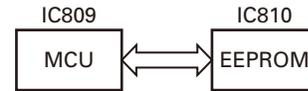

Fig. 8 Memory circuit

#### 6-3. Low Battery Warning

The battery voltage is monitored by the MCU (IC809 pin 86: BATT). When the battery voltage falls below the voltage set by the Low Battery Warning adjustment, the red LED blinks, notifying the operator that it is time to replace the battery (when the always option (default setting) under the Battery Warning function in the FPU is selected). If the battery voltage falls below 5.9V, the transceiver does not transmit and the warning tone beeps while the PTT switch is pressed.

Low battery warning	Battery status
The red LED blinks during transmission.	The battery voltage is low but the transceiver is still usable.
The red LED blinks and the warning tone beeps while the PTT switch is pressed.	The battery voltage is low and the transceiver cannot be used to make calls.

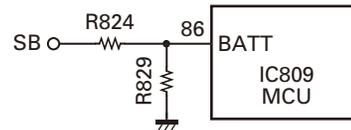

Fig. 9 Low battery warning

#### 6-4. Battery Type Detection

The transceiver automatically detects the battery type, measuring the resistance between the S-terminal and +terminal on the battery pack and changes the supplied voltage to the S-terminal as below. The MCU then detects the battery type.

Resistor value	Battery type	Input voltage of S-terminal
1.8MΩ	Li-ion	0.3~1.3V
560kΩ	Ni-Cd	1.3~2.6V
220kΩ	Ni-MH	2.6~5.0V
OPEN	Battery case	0~0.3V

## CIRCUIT DESCRIPTION

### 6-5. Key Input

Keys and channel selector circuit.

The signal from the keys and channel selector are directly input to the MCU, as shown in Figure 10.

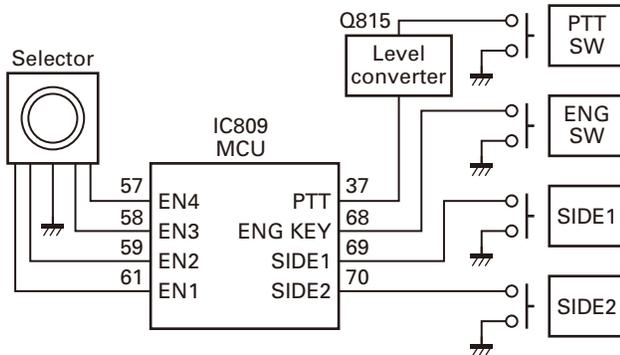

Fig. 10 Key input

## 7. Signaling Circuit

### 7-1. Encode

#### ■ Low-speed data (QT, DQT)

Low-speed data is output from pin 24 of the MCU. The signal passes through the low pass CR filter, and goes to the audio processor (IC812). The signal is mixed with the audio signal and goes to the VCO and TCXO (X1) modulation input after passing through the D/A converter inside the audio processor (IC812) for BAL adjustment.

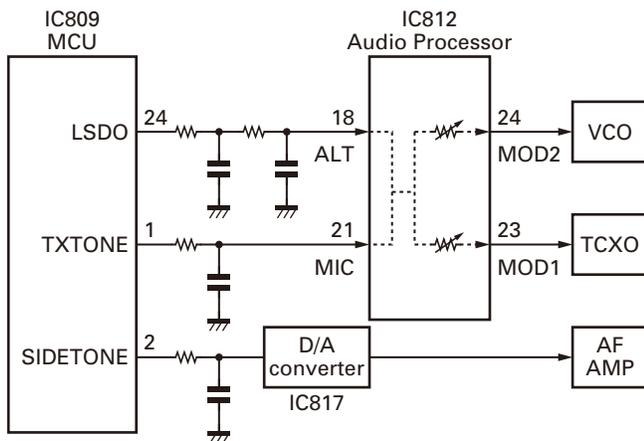

Fig. 11 Encode

#### ■ High-speed data (2-tone, DTMF)

High-speed data (HDS) is output from pin 1 of the MCU. HDS deviation made by an adjustment in the MCU is passed through the low pass CR filter and then applied to the audio processor (IC812).

The signal is mixed with the audio signal and goes to the VCO and TCXO. The side tone is output from Pin 2 of the MCU. The signal passes through low pass CR filter and D/A converter, and goes to the audio power amplifier. The level is controlled by the MCU.

#### ■ MSK

The MSK signal is generated in the audio processor (IC812). The signal passes through the D/A converter (inside the audio processor: IC812) and is routed to the VCO. When encoding the MSK, the microphone input signal is muted.

### 7-2. Dcode

#### ■ QT/DQT

The output signal from the IF IC (IC401) enters the MCU (IC809) through IC812. IC809 determines whether or not the QT or DQT matches the preset value, and controls the AFSW and speaker output sounds according to the squelch results.

#### ■ 2-tone

Part of the received AF signal output from the IF IC (IC401) passes through an audio processor (IC812) goes to the other AF amplifier IC808 and 816, is compared, and then goes to IC809. IC809 checks whether or not the 2-tone data is necessary. If it matches, IC809 carries out a specified operation, such as turning the speaker on.

#### ■ MSK (Fleet Sync)

The MSK input signal from the IF IC (IC401) goes to IC812. The decoded information is then processed by the MCU.

#### ■ DTMF

The DTMF input signal from the IF IC (IC401) goes to IC812. The decoded information is then processed by the MCU.

## 8. Power Supply

There are five 5V power supplies and three 3.3V power supplies: 50M, 50V, 50C, 50R, 50T, 33M, 33MSC and 33BC.

50M and 33M are always output while the power is on. 33MS is always output, but turns off when the power is turned off, to prevent malfunction of the MCU.

50C is a common 5V and is output when SAVE is not set to ON.

50R is 5V for reception and output during reception.

50T is 5V for transmission and output during transmission.

50V is 5V for the SP/MIC connector.

33B is 3.3V for the audio processor (IC812).

### ■ Antenna connector adapter

The antenna connector of this transceiver uses an SMA terminal.

Use an antenna connector adapter [SMA(f) – BNC(f) or SMA(f) – N(f)] for adjustment. (The adapter is not provided as an option, so buy a commercially-available one.)

### ■ Repair Jig (Chassis)

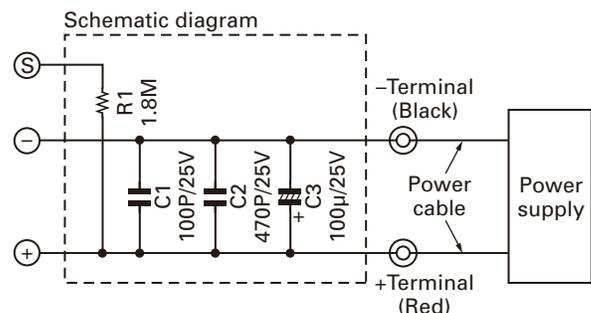

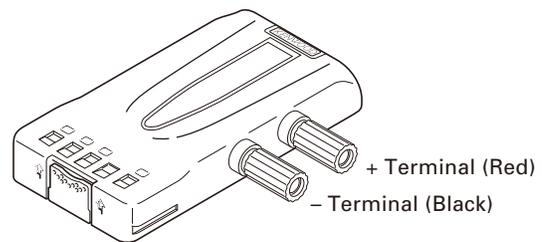

Use jig (part No.: A10-4134-03) for repairing the transceiver. Place the TX-RX unit on the jig and fit it with screws.

The jig facilitates the voltage check and protects the final amplifier FET when the voltage on the flow side of the TX-RX unit is checked during repairs.

### ■ Battery Jig (W05-0909-00)

Connect the power cable properly between the battery jig installed in the transceiver and the power supply, and be sure output voltage and the power supply polarity prior to switching the power supply ON, otherwise over voltage and reverse connection may damage the transceiver, or the power supply or both.

**Note:** When using the battery jig, you must measure the voltage at the terminals of the battery jig. Otherwise, a slight voltage drop may occur within the power cable, between the power supply and the battery jig, especially while the transceiver transmits.

## ADJUSTMENT

### Frequency and Signaling

### Preparations for Tuning the Transceiver

Before attempting to tune the transceiver, connect the unit to a suitable power supply.

Whenever the transmitter is tuned, the unit must be connected to a suitable dummy load (i.e. power meter).

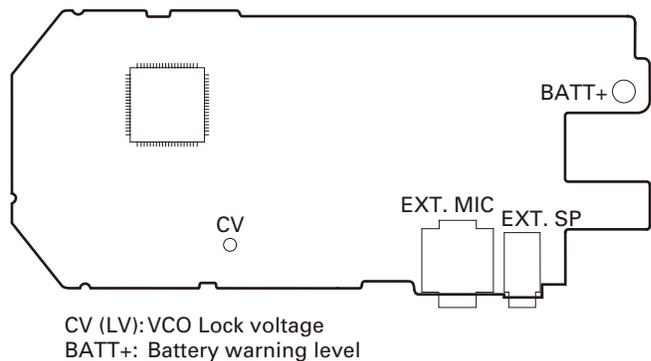

The speaker output connector must be terminated with a 8Ω dummy load and connected to an AC voltmeter and an audio distortion meter or a SINAD measurement meter at all times during tuning.
