

User Manual

Wireless ADSL2+ Modem Router

Model No. SP3367A

<http://www.micronet.info>

CE Declaration of conformity

This equipment complies with the requirements relating to electromagnetic compatibility, EN55022 class A for ITE, the essential protection requirement of Council Directive 89/336/EEC on the approximation of the laws of the Member States relating to electromagnetic compatibility.

FCC Part 68

This equipment complies with Part 68 of the FCC Rules. On the bottom of this equipment is a label that contains the FCC Registration Number and Ringer Equivalence Number (REN) for this equipment. You must provide this information to the telephone company upon request.

The REN is useful to determine the quantity of devices you may connect to the telephone line and still have all of those devices ring when your number is called. In most, but not all areas, the sum of the REN of all devices connected to one line should not exceed five (5.0). To be certain of the number of devices you may connect to your line, as determined by the REN, you should contact your local telephone company to determine the maximum REN for your calling area.

If the modem causes harm to the telephone network, the telephone company may discontinue your service temporarily. If possible, they will notify you in advance. But if advance notice isn't practical, you will be notified as soon as possible. You will be advised of your right to file a complaint with the FCC.

The telephone company may make changes in its facilities, equipment, operations, or procedures that could affect the proper operation of your equipment. If they do, you will be notified in advance to give you an opportunity to maintain uninterrupted telephone service.

If you experience trouble with this modem, please contact your dealer for repair/warranty information. The telephone company may ask you to disconnect this equipment from the network until the problem has been corrected or you are sure that the equipment is not malfunctioning.

This equipment may not be used on coin service provided by the telephone company. Connection to party lines is subject to state tariffs.

Installation

This device is equipped with a USOC RJ11C connector.

FCC Part 15

The modem generates and uses radio frequency energy. If it is not installed and used properly in strict accordance with the user's manual, it may cause interference with radio and television reception. The modem has been tested and found to comply with the limits for Class B computing devices in accordance with the specifications in Subpart B, Part 15 of the FCC regulations. These specifications are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that interference will not occur in a particular

installation. FCC regulations require that shielded interface cables be used with your modem.

If interference does occur, we suggest the following measures be taken to rectify the problem:

- 1) Move the receiving antenna.
- 2) Move the modem away from the radio or TV.
- 3) Plug the modem into a different electrical outlet.
- 4) Discuss the problem with a qualified radio / TV technician.

CAUTION:

Changes or modifications not expressly approved by the party responsible for compliance to the FCC Rules could void the user's authority to operate this equipment.

Cable connections:

All equipment connected to this modem must use shielded cable as the interconnection means.

Notes:

Operation is subject to the following two conditions:

- 1) This device may not cause harmful interference, and
- 2) This device must accept any interference received including interference that may cause undesired operation.

Chapter 1 Introduction

The ADSL2+ Router provides home connectivity to an ADSL service provider network over an ADSL/ Asynchronous Transfer Mode (ATM) physical layer. The router can run upstream maximum transmission rates of 2Mbps and downstream maximum transmission rates of 24Mbps. The actual rate depends on the copper category of your telephone wire, distance from the central office and the type of ADSL2+ service subscribed. Four ports switch is provided for connection to an Ethernet LAN or Ethernet-equipped PC and this router is easy to install and to configure.

1.1 Overview

The ADSL2+ wireless Router is optimized to address the growing demand for high-speed Internet access and it does so as a single, highly-integrated and cost-effective solution.

1.2 Features

ADSL2/2+ Compliance

- ◆ Compliant with ADSL standards
- ◆ Full-rate ANSI.413 Issue 2 , ITU G.dmt (G.992.1) , G.dmt bis (G.992.3) and G.adslplus(G.992.5) standards
Splitter less ITU G.lite (G.992.2) specification
Annex A (ADSL over POTS) and Annex B (ADSL over ISDN), compliant to ETSI TS 101 388
- ◆ DMT modulation and demodulation
- ◆ Full-rate adaptive modem
Maximum downstream rate of 24 Mbps
Maximum upstream rate of 2 Mbps
- ◆ Tone detection for low power mode
- ◆ Supports splitter less ADSL implementation
- ◆ Interoperable with all major DSLAM equipment

ATM Protocols

- ◆ WAN mode support: PPP over ATM (RFC 2364) and PPP over Ethernet (RFC 2516)
- ◆ LAN mode support: bridged/routed Ethernet over ATM (RFC 2684) and classical IP over ATM (RFC 1577)
- ◆ Up to 8 VCs (virtual circuits)
- ◆ ATM SAR (segmentation and reassembly)
- ◆ ATM AALC (adaption layer type 5)

Bridge Mode

- ◆ Ethernet to ADSL self learning Transparent Bridging (IEEE 802.1D)
- ◆ Supports MAC learning addresses

Router Mode

- ◆ IP routing-RIPv2
- ◆ Static routing
- ◆ DNS Proxy
- ◆ Dynamic DNS
- ◆ DMZ
- ◆ Port Forwarding
- ◆ DHCP (dynamic host configuration protocol) server and client
- ◆ NAT (network address translation)
- ◆ ICMP (Internet control message protocol)

Wireless Features

- ◆ Support 802.11b/g Wireless Access Point
- ◆ Support shared 128-Bit and 64-Bit WEP encryption, WPA-PSK

Security

- ◆ Stateful packet inspection and filtering
- ◆ Intrusion detection and protection
- ◆ PAP (password authentication protocol)
- ◆ CHAP (challenge authentication protocol)
- ◆ Password protected system management

Ethernet Interface

- ◆ Compliant with IEEE 802.3 and 802.3u 10/100 Mbps

HTTP Web-Based Management

- ◆ Firmware upgrade by UI
- ◆ Customizable Web pages
- ◆ WAN and LAN side connection statistics
- ◆ Configuration of static routes and routing table
- ◆ Password protected access
- ◆ Wireless Lan
- ◆ System log
- ◆ Configuration of VCs (virtual circuits)

1.3 System Requirements

- ◆ Personal computer (PC)
- ◆ Pentium II 233 MHz processor minimum
- ◆ 32 MB RAM minimum
- ◆ 20 MB of free disk space minimum
- ◆ Ethernet Network Interface Controller (NIC) RJ45 Port
- ◆ Internet Browser

Chapter 2 Installation

This chapter offers information about installing your router. If you are not familiar with the hardware or software parameters presented here, please consult your service provider for the values needed.

2.1 Checklist

Check the shipping box carefully to ensure that the contents include the items you ordered. If any of the items are missing or damaged, contact your local distributor.

Contents description

- ◆ 54M Wireless ADSL2+ Modem Router
- ◆ Quick Installation Guide
- ◆ User manual CD
- ◆ ADSL RJ-11 telephone cable
- ◆ Ethernet RJ-45 cable
- ◆ Power adapter

2.2 The Front LEDs

LED	State	Description
PWR	ON	When the router power on
WLAN	Off	When wireless AP is disabled
	Blinking	While wireless traffic is transmitting or receiving
ADSL	On	Connected to an ADSL DSLAM successfully
	Blinking	No connection
LAN LINK/ ACT (Port 1 - 4)	On	The LAN cable is connected to the router
	Off	No network connection
	Blinking	Network traffic transferring or receiving through the LAN port

2.3 The Rear Ports

Connector	Description
Antenna Connector	Reverse SMA connector
Reset	The reset button, the router restore default settings when press until reboot
POWER	Power connector with 12VDC/ 1 Ampere
LAN (1-4)	Router is successfully connected to a device through the corresponding port (1, 2, 3 or 4). If the LED is flashing, the Router is actively sending or receiving data over that port.
ADSL	The RJ-11 connector allows data communication between the modem and the ADSL network through a twisted-pair phone wire

2.4 Hardware installation

This section describes how to connect and configure the ADSL router.

1) Connect the ADSL line

Connect the router directly to the wall jack using the included ADSL RJ-11 telephone cable.

2) Connect a workstation to the Router's LAN port

Use Ethernet RJ-45 cable to connect computer or expand Ethernet network.

3) Connect the power adapter to the Router

Connect the power adapter to the port labeled POWER on the rear panel of router.

4) Connect all cables to the Network

The procedure for connecting cables differs depending on whether or not your telephone equipment is connected to a POTS splitter. The next section explains ADSL splitter and describes the configuration in networks of ADSL over POTS and ADSL over ISDN.

2.5 Splitter Configuration

ADSL splitter builds-on a micro-filter it stops the ADSL signal interfering with the voice part of your phone line. The graph hereunder shows the frequency range that your phone (POTS) and ADSL occupy. Use ADSL splitter to separate the bands for POTS and ADSL and get better communication quality.

POTS Splitter Configuration (ADSL over POTS)

A POTS splitter separates data signals from voice signals on your telephone line. The POTS splitter works by running a separate data line from the voice line, so that the ADSL router has a cable dedicated for data transmission. Figure 2-5.1 and 2-5.2 shows how to connect all cables to the Router.

Figure 2-5.1 Router connected through a POTS Splitter

Note: The POTS splitter may also be installed on the outside of the house adjacent to the telephone network interface device (NID).

Figure 2-5.2 Router connected through several micro-filters

ISDN Splitter Configuration (ADSL over ISDN)

A ISDN splitter separates ADSL signals from ISDN signals on your ISDN telephone line. The ISDN splitter works by running a separate ADSL line from the ISDN line, so that the ADSL router has a cable dedicated for data transmission. Figure 2-5.3 shows how to connect all cables to the Router.

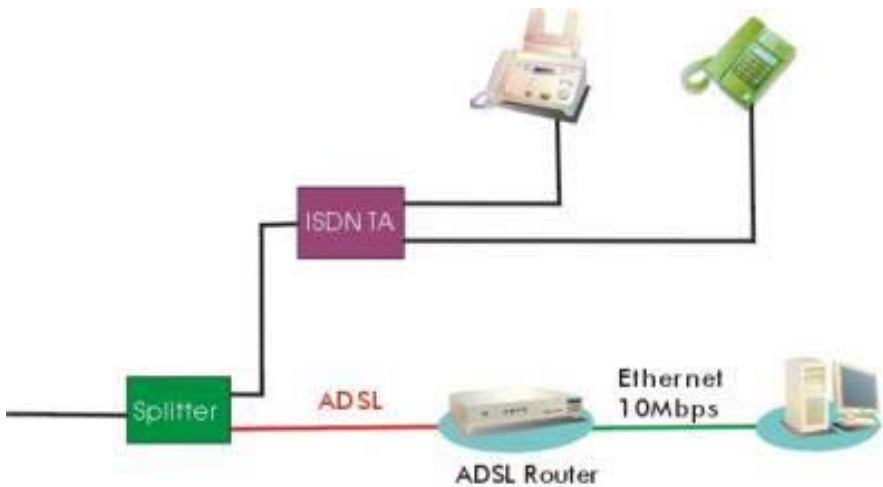

Figure 2-5.3 Router Connected through a ISDN Splitter

Note: The ISDN splitter may also be installed on the outside of the house adjacent to the telephone network interface device (NID).

Chapter 3 Connection

3.1 Determine connection settings

Before configure the router, you need to know the connection information supplied by your ADSL service provider.

3.2 Connecting the Router to network

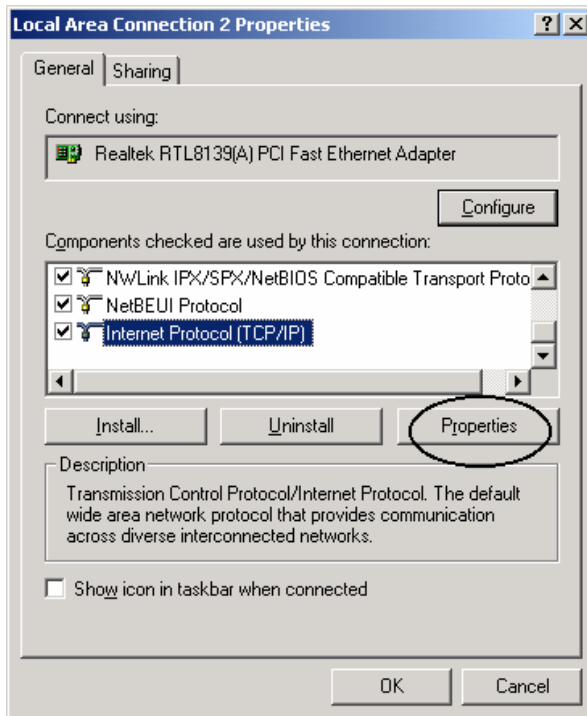

Unlike a simple hub or switch, the setup of the ADSL Router consists of more than simply plugging everything together. Because the Router acts as a DHCP server, you will have to set some values within the Router and also configure your networked PCs to accept the IP Addresses the Router chooses to assign to them. Generally, there are several different operating modes for your applications. Your ISP will tell you which mode is necessary for your system. The modes available are router, bridge, PPPoE+NAT and PPPoA+NAT.

3.3 The relative configuration on PC

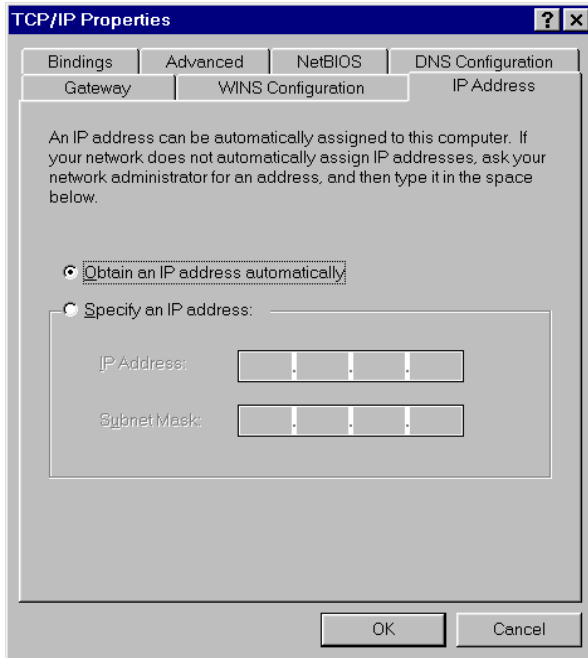

Please follow the steps instructed below when installing your system for the first time via web console:

- 1) Shut down the power on everything, including your PCs and ADSL Router.

- 2) Connect a network cable from one of your PCs' Ethernet ports to the LAN port on the back of the Router.
- 3) Connect the power adapter to the Power port on the rear of the Router then connect to a power outlet using the power cord included in the Router's packaging.
- 4) Power on one of your PCs. Click the **Start** button, select **Settings** and then select **Control Panel**.
- 5) Double-click the **Network** icon.

- 6) In the **Configuration** window, highlight the **TCP/IP** that has been associated with your network card or adapter. (Do NOT configure TCP/IP Dial-up Adapter.) Click **Properties**. If the **TCP/IP Protocol** isn't listed in the **Configuration** window, install it.
- 7) Click the IP Address tab. Select "**Obtain an IP address automatically**". Click **OK**.

- 8) Click **OK** again. Windows may begin copying files to your computer. (In Windows 98, system will ask you to restart your PC. Click **Yes** to restart your computer and initiate the new settings.)

Chapter 4 Configuration

4.1 Access the Modem Router

It is advised that the administrator password be changed to safeguard the security of your network.

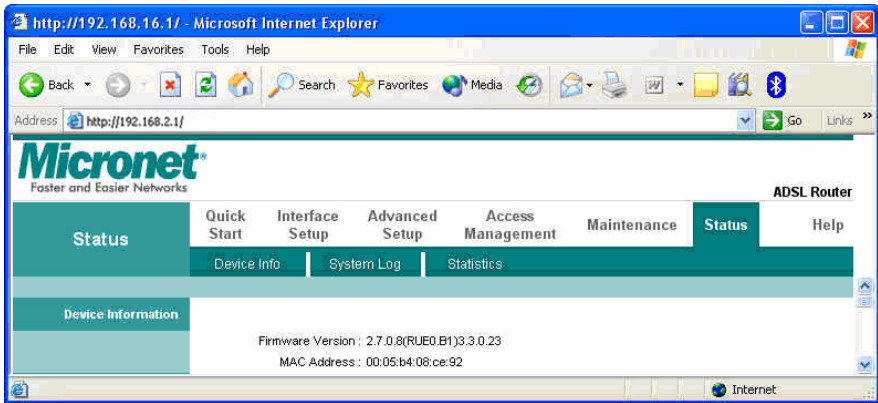

To configure the router, open your browser, type **http://192.168.2.1** into the address bar and click **Go** to get to the login page.

Save this address in your Favorites for future reference.

At the User name prompt, type **admin**. And the Password prompt, type **admin**. You can change these later if you wish. Click **OK**.

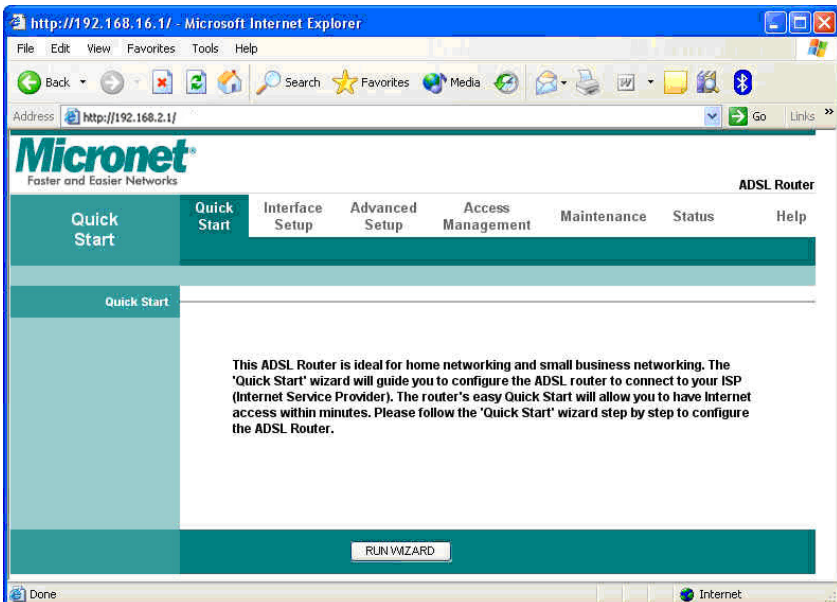

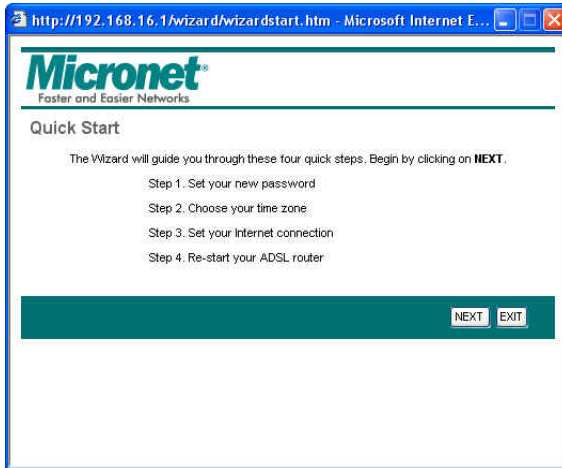

4.2 Quick Setup

You can use **Quick Setup** to setup the router as follows, and the router will connect to the Internet via ADSL line.

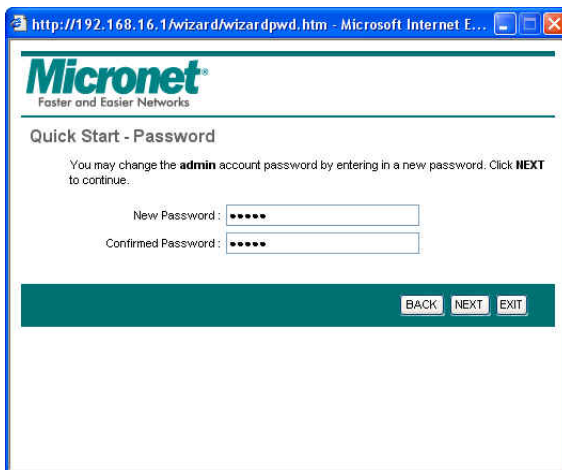

Click **Quick Start** to get into the quick setup procedures.

Click **RUN WIZARD** to start up this procedure.

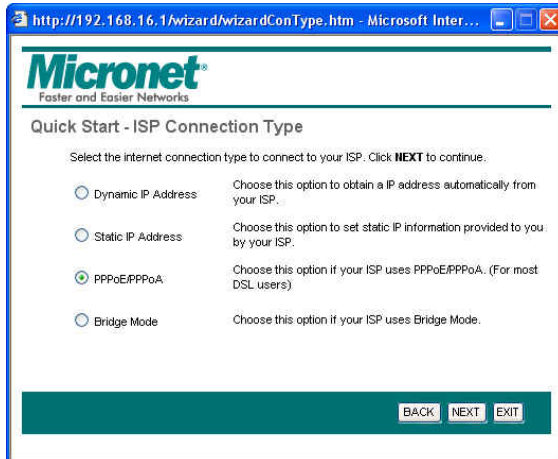

Step 1 - Click **Next** to setup your new administrator's password.

Step 2 - Click **Next** to setup your time zone.

Step 3 - Click **Next** to setup your Internet connection type. You can have this information from your Internet Service Provider.

Enter the connection information provided by your ISP. Click **Next** twice then close the Wizard.

The screenshot shows a web browser window with the URL `http://192.168.16.1/wizard/wizardPPP.htm`. The page features the Micronet logo and the tagline "Faster and Easier Networks". The main heading is "Quick Start - PPPoE/PPPoA". Below this, a message reads: "Enter the PPPoE/PPPoA information provided to you by your ISP. Click **NEXT** to continue." The form contains the following fields:

- Username:
- Password:
- VPI: (0~255)
- VCI: (1~65535)
- Connection Type:

At the bottom of the form, there are three buttons: "BACK", "NEXT", and "EXIT".

The screenshot shows a web browser window with the URL `http://192.168.16.1/wizard/wizardcomp.htm`. The page features the Micronet logo and the tagline "Faster and Easier Networks". The main heading is "Quick Start Complete !!". Below this, a message reads: "The Setup Wizard has completed. Click on **BACK** to modify changes or mistakes. Click **NEXT** to save the current settings." At the bottom of the page, there are three buttons: "BACK", "NEXT", and "EXIT".

The screenshot shows a web browser window with the URL `http://192.168.16.1/wizard/wizardclose.htm`. The page features the Micronet logo and the tagline "Faster and Easier Networks". The main heading is "Quick Start Completed !!". Below this, a message reads: "Saved Changes." At the bottom of the page, there is a single button: "CLOSE".

4.3 Interface Setup

4.3.1 Internet

ATM VC Configuration

Go to **Interface Setup** → **Internet**. To add or delete ADSL VC configuration, these information provide by ISP.

Micronet
Faster and Easier Networks

ADSL Router

Interface	Quick Start	Interface Setup	Advanced Setup	Access Management	Maintenance	Status	Help
	Internet	LAN	Wireless				

PPPoE/PPPoA

Connection Setting

Username : 85238998@hinet.net
Password : ●●●●●●●●
Encapsulation : PPPoE LLC
Bridge Interface : Activated Deactivated

Connection : Always On (Recommended)
 Connect On-Demand (Close if idle for minutes)
 Connect Manually

TCP MSS Option : TCP MSS(0 default) bytes

IP Address

Get IP Address : Static Dynamic
Static IP Address :
IP Subnet Mask :
Gateway :
NAT : Enable
Default Route : Yes No
TCP MTU Option : TCP MTU(0 default) bytes
Dynamic Route : RIP1 Direction Both
Multicast : Disabled

WAN Configuration

Go to **Interface Setup** → **Internet**. The router can be connected to your service provider in any of the following ways. Check the radio box of the service provided by your ISP, then the related settings will pop up in this page under **Encapsulation**. Configure the related settings, then click **SAVE** to save it.

Dynamic IP Address: Obtain an IP address automatically from your service provider.

The screenshot shows the configuration page for the WAN interface of a Micronet ADSL Router. The page has a header with the Micronet logo and the text "Faster and Easier Networks" on the left, and "ADSL Router" on the right. Below the header is a navigation menu with tabs: "Quick Start", "Interface Setup", "Advanced Setup", "Access Management", "Maintenance", "Status", and "Help". The "Interface Setup" tab is active, and within it, the "Internet" sub-tab is selected. The main content area is divided into sections: "QoS", "Encapsulation", and "Dynamic IP".

QoS

VPI: (range: 0~255)
VCI: (range: 1~65535)

ATM QoS:
PCR: cells/second
SCR: cells/second
MBS: cells

Encapsulation

ISP: Dynamic IP Address
 Static IP Address
 PPPoA/PPPoE
 Bridge Mode

Dynamic IP

Encapsulation:
NAT:
Default Route: Yes No
TCP MTU Option: TCP MTU(0:default) bytes
Dynamic Route: Direction:
Multicast:

Static IP Address: Uses a static IP address. Your service provider gives a static IP address to access Internet services.

Micronet
Faster and Easier Networks

TCP MTU Option: TCP MTU(0:default) bytes

Dynamic Route: Direction

Multicast:

SAVE

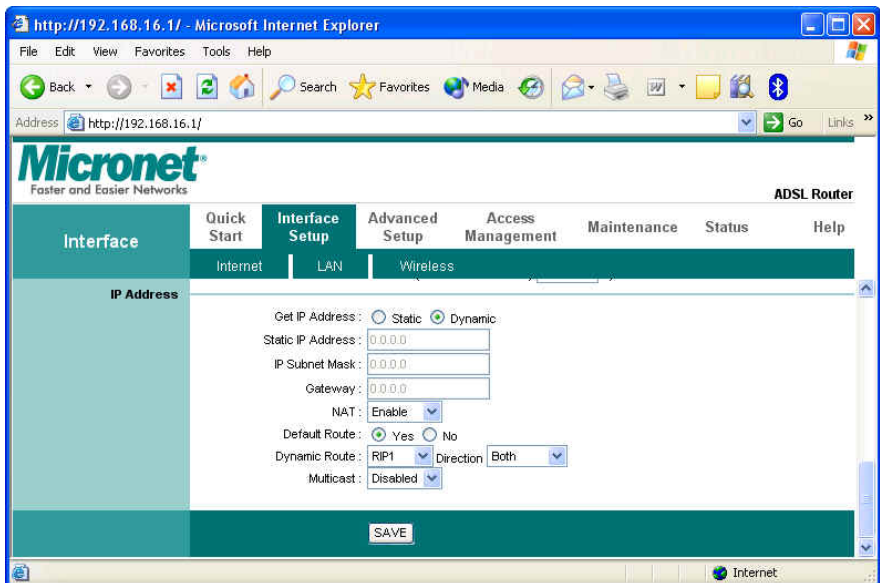

Bridge: Bridge mode is a common connection method used for xDSL modem.

Dynamic Routing

Go to **Interface Setup** → **Internet** to select the **Dynamic Route** needed.

The dynamic routing feature of the router can be used to allow the router to automatically adjust to physical changes in the network's layout. The router uses the dynamic RIP protocol. It determines the route that the network packets take based on the fewest number of hops between the source and the destination. The RIP protocol broadcasts routing information to other routers on the network regularly.

4.3.2 LAN Configuration

Go to **Interface Setup** → **LAN**. The **LAN Settings** option enables you to configure the LAN port.

DHCP Relay

DHCP Relay forwards local clients' DHCP requests to WAN site DHCP server. Three settings have to be configured when enabling the function: (1) disable the NAT and run on route mode only; (2) disable the DHCP server on the local network site; (3) make sure the routing table has the correct routing entry.

The screenshot shows the configuration page for the LAN interface on a Micronet ADSL Router. The page is titled "Interface" and has tabs for "Quick Start", "Interface Setup", "Advanced Setup", "Access Management", "Maintenance", "Status", and "Help". The "Interface Setup" tab is active, and the "LAN" sub-tab is selected. The page is divided into several sections: "Router Local IP", "DHCP", "DHCP Server", and "DNS".

Micronet
Faster and Easier Networks

ADSL Router

Interface: Quick Start | **Interface Setup** | Advanced Setup | Access Management | Maintenance | Status | Help

Internet | **LAN** | Wireless

Router Local IP

IP Address: 192.168.21
IP Subnet Mask: 255.255.255.0
Dynamic Route: RIP2-B Direction: None
Multicast: Disabled
IGMP Snoop: Disabled Enabled

DHCP

DHCP: Disabled Enabled Relay

DHCP Server

Starting IP Address: 192.168.1.100
IP Pool Count: 100
Lease Time: 259200 seconds (0 sets to default value of 259200)

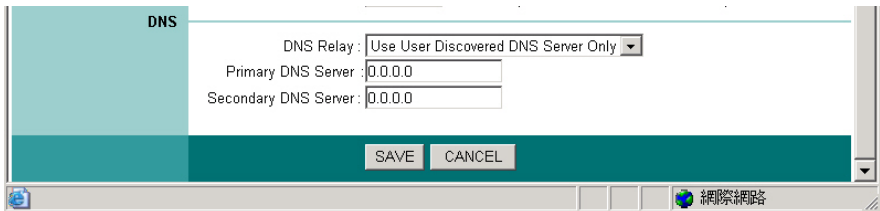

DNS

DNS Relay: Use Auto Discovered DNS Server Only
Primary DNS Server: N/A
Secondary DNS Server: N/A

DNS

Go to **Interface** → **LAN** to enable **DHCP server**. Then you can set **DNS server** for the router. A Domain Name system (DNS) server is like an index of IP addresses and Web addresses. If you type a Web address into your browser, a DNS server will find that name in its index and find the matching IP address.

Most ISPs provide a DNS server for speed and convenience. Since your Service Provider may connect to the Internet with dynamic IP settings, it is likely that the DNS server IP addresses are also provided dynamically. However, if there is a preferred DNS server, you need to specify the IP address of that DNS server in DNS. Select DNS Relay “Use User Discovered DNS Server Only” then key in the IP address of the DNS Server in the box.

The screenshot shows a web-based configuration interface for DNS settings. The title bar reads "DNS". The interface includes a dropdown menu for "DNS Relay" set to "Use User Discovered DNS Server Only", and two input fields for "Primary DNS Server" and "Secondary DNS Server", both containing "0.0.0.0". At the bottom, there are "SAVE" and "CANCEL" buttons. The interface is styled with a teal header and footer, and a light blue sidebar on the left. The footer contains a small logo and the text "网络配置".

4.3.3 Wireless Settings

Go to **Interface** → **Wireless** to setup the wireless parameters.

The screenshot shows the configuration interface for the wireless settings of a Micronet ADSL Router. The page has a teal header with the Micronet logo and the text 'Faster and Easier Networks' on the left, and 'ADSL Router' on the right. Below the header is a navigation menu with tabs for 'Interface', 'Quick Start', 'Interface Setup', 'Advanced Setup', 'Access Management', 'Maintenance', 'Status', and 'Help'. The 'Interface Setup' tab is active, and within it, the 'Wireless' sub-tab is selected. The main content area is divided into three sections: 'Access Point Settings', 'Multiple SSIDs Settings', and 'Wireless MAC Address Filter'. In the 'Access Point Settings' section, the 'Access Point' is set to 'Activated', the 'Channel' is 'Undefined' (with a dropdown arrow), 'Current Channel' is '10', 'Beacon Interval' is '100', 'RTS/CTS Threshold' is '2347', 'Fragmentation Threshold' is '2346', 'DTIM' is '1', and '802.11 b/g' is set to '802.11b+g'. The 'Multiple SSIDs Settings' section shows 'SSID Index' as '1', 'SSID' as 'Default', 'Broadcast SSID' as 'Yes', and 'Authentication Type' as 'Disabled'. The 'Wireless MAC Address Filter' section shows 'Active' as 'Deactivated', 'Action' as 'Allow Association', and 'Mac Address #1' as '00:00:00:00:00:00'.

SSID

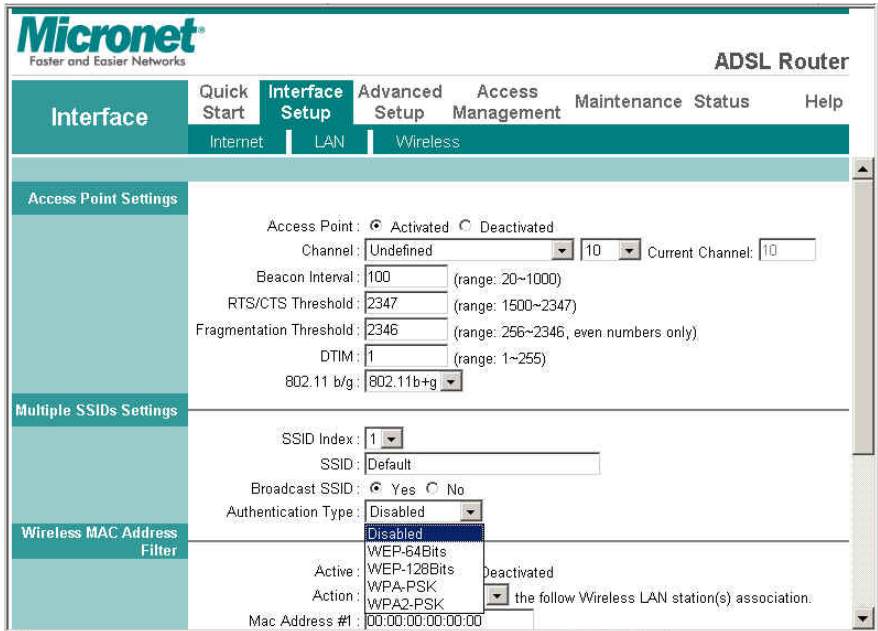

SSID is the identifier for the network. You can change the SSID. Only devices with the same SSID can interconnect.

Channel ID

The channel number is used for wireless networking. The channel setting of the wireless devices within a network should be the same.

Wireless Security

The Authentication type supports “shared key WEP 64bits”, "shared key WEP 128bits”, “WPA-PSK”.

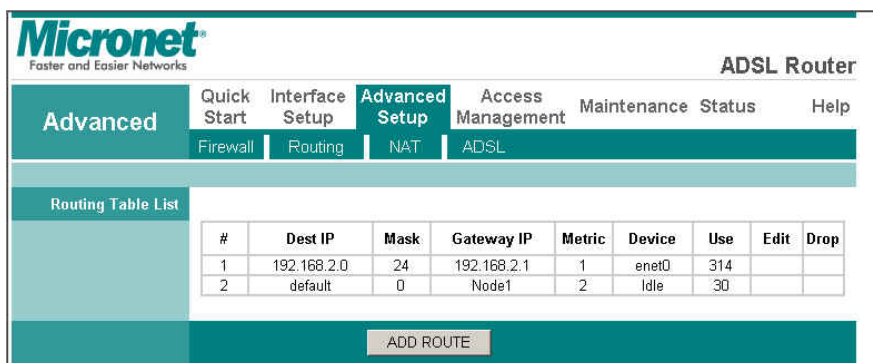

4.4 Advanced Setup

4.4.1 Routing Table

Go to **Advance Setup** → **Routing** to see the Routing Table.

The Routing table allows you to see how many routings are on the network.

It shows the interface information.

The screenshot shows the Micronet ADSL Router configuration interface. The top navigation bar includes 'Advanced', 'Quick Start', 'Interface Setup', 'Advanced Setup', 'Access Management', 'Maintenance', 'Status', and 'Help'. The 'Advanced Setup' menu is expanded, showing 'Firewall', 'Routing', 'NAT', and 'ADSL'. The 'Routing Table List' section displays a table with the following data:

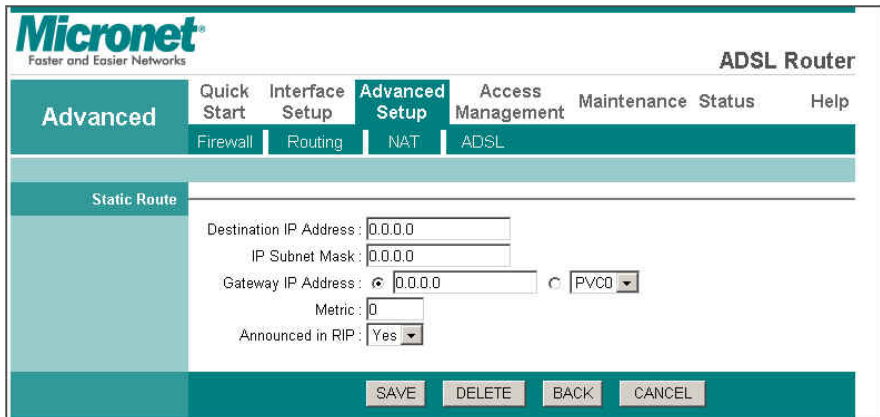

#	Dest IP	Mask	Gateway IP	Metric	Device	Use	Edit	Drop
1	192.168.2.0	24	192.168.2.1	1	enet0	314		
2	default	0	Node1	2	Idle	30		

Below the table is an 'ADD ROUTE' button.

Static Routing

Go to **Advance Setup** → **Routing** → **ADD ROUTE** to set up static route features.

The static routing function determines the path that router follows over the network before and after it passes through this router. You can use static routing to allow different IP domain users to access the Internet through this device.

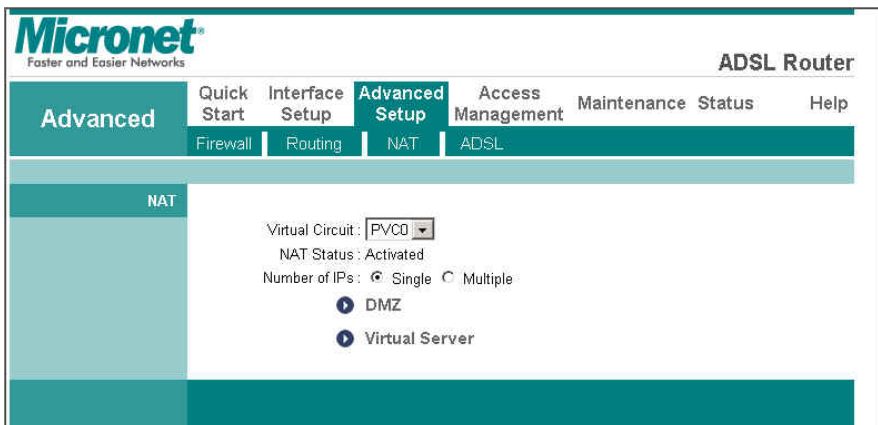

The screenshot shows the Micronet ADSL Router configuration interface. At the top left is the Micronet logo with the tagline "Faster and Easier Networks". The page title is "ADSL Router". A navigation menu includes "Quick Start", "Interface Setup", "Advanced Setup", "Access Management", "Maintenance Status", and "Help". Under "Advanced Setup", there are sub-menus for "Firewall", "Routing", "NAT", and "ADSL". The "Static Route" configuration page is active, showing the following fields:

- Destination IP Address: 0.0.0.0
- IP Subnet Mask: 0.0.0.0
- Gateway IP Address: 0.0.0.0 (with a dropdown menu set to PVC0)
- Metric: 0
- Announced in RIP: Yes (with a dropdown menu)

At the bottom of the form are four buttons: "SAVE", "DELETE", "BACK", and "CANCEL".

4.4.2 NAT Setting

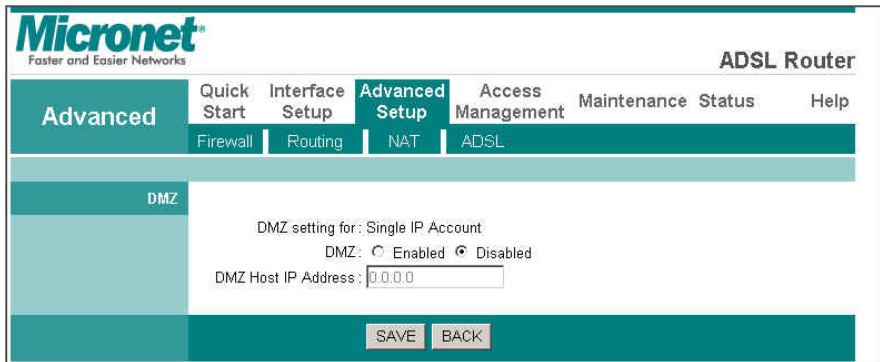

Go to **Advanced Setup** → **NAT** to set up the NAT features. Network Address Translation (NAT) allows multiple users at your local site to access the Internet through a single public IP address or multiple public IP addresses. NAT can also prevent hacker attacks by mapping local addresses to public addresses for key services such as the Web or FTP.

DMZ Setting

Go to **Advanced Setup** → **NAT** → **DMZ** to set DMZ parameters.

If you have a local client PC that cannot run an Internet application properly behind the NAT firewall, you can open the client up to unrestricted two-way Internet access by defining a virtual DMZ Host.

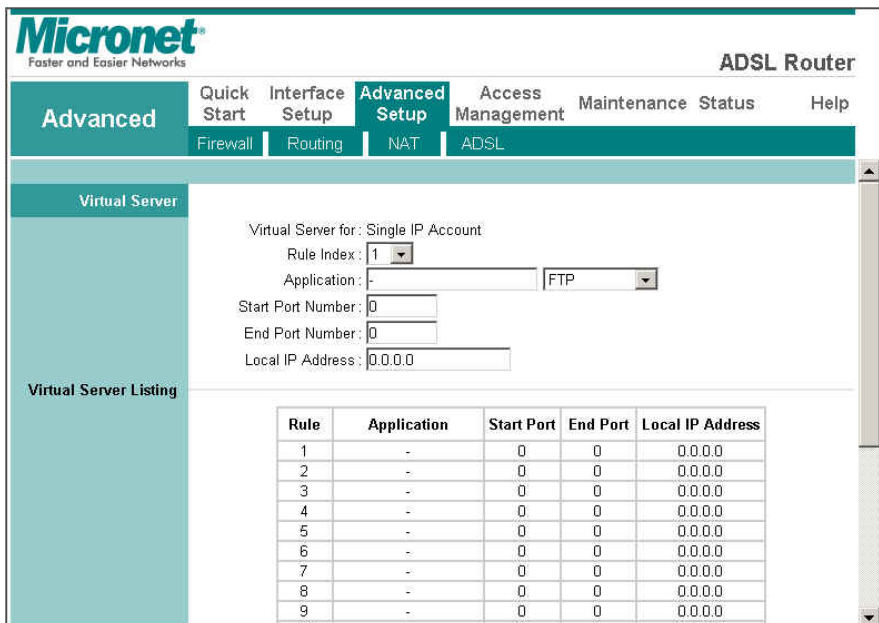

The screenshot shows the Micronet ADSL Router web interface. The top navigation bar includes the Micronet logo, the tagline "Faster and Easier Networks", and the text "ADSL Router". Below this is a menu with options: "Advanced" (selected), "Quick Start", "Interface Setup", "Advanced Setup", "Access Management", "Maintenance Status", and "Help". Under "Advanced Setup", there are sub-menus for "Firewall", "Routing", "NAT", and "ADSL". The main content area is titled "DMZ" and contains the following text: "DMZ setting for: Single IP Account", "DMZ: Enabled Disabled", and "DMZ Host IP Address: ". At the bottom of the page, there are two buttons: "SAVE" and "BACK".

Virtual Server

Go to **Advanced Setup** → **NAT** → **Virtual Server** to set virtual server as needed (known as Port Mapping).

Virtual server opens the port(s) for specified service and maps the port(s) to the private IP address of the server. It allows remote users accessing services such as the Web or FTP at the local site via public IP address. In other words, it redirects the request from Internet to the local server which is configured with private IP address.

Some applications will require a set or a range of ports (example 4000~5000) to a specified local machine to route the packets. The router allows user to configure the needed port mappings to suit such applications.

The screenshot shows the Micronet ADSL Router configuration interface. The top navigation bar includes 'Advanced', 'Quick Start', 'Interface Setup', 'Advanced Setup', 'Access Management', 'Maintenance Status', and 'Help'. The 'Advanced Setup' menu is expanded to show 'Firewall', 'Routing', 'NAT', and 'ADSL'. The 'Virtual Server' configuration page is displayed, showing a 'Virtual Server for: Single IP Account' section with fields for 'Rule Index' (set to 1), 'Application' (set to FTP), 'Start Port Number' (0), 'End Port Number' (0), and 'Local IP Address' (0.0.0.0). Below this is a 'Virtual Server Listing' table with columns for Rule, Application, Start Port, End Port, and Local IP Address.

Rule	Application	Start Port	End Port	Local IP Address
1	-	0	0	0.0.0.0
2	-	0	0	0.0.0.0
3	-	0	0	0.0.0.0
4	-	0	0	0.0.0.0
5	-	0	0	0.0.0.0
6	-	0	0	0.0.0.0
7	-	0	0	0.0.0.0
8	-	0	0	0.0.0.0
9	-	0	0	0.0.0.0
10	-	0	0	0.0.0.0

4.4.3 ADSL

Go to **Advanced Setup** → **ADSL** to set up the ADSL mode and ADSL type. ISP should provide you the details required.

Micronet
Faster and Easier Networks

ADSL Router

Advanced	Quick Start	Interface Setup	Advanced Setup	Access Management	Maintenance	Status	Help
	Firewall	Routing	NAT	ADSL			

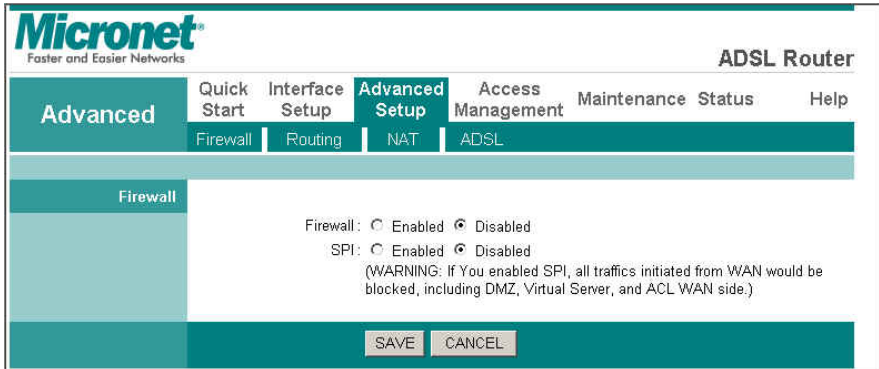

ADSL

ADSL Mode:

ADSL Type:

4.4.4 Firewall

Go to **Advanced Setup** → **Firewall** to enable or disable Firewall feature.

The screenshot shows the Micronet ADSL Router configuration interface. The top navigation bar includes the Micronet logo, the text "Faster and Easier Networks", and the title "ADSL Router". Below this is a menu with options: "Advanced", "Quick Start", "Interface Setup", "Advanced Setup", "Access Management", "Maintenance Status", and "Help". The "Advanced Setup" menu is expanded, showing sub-options: "Firewall", "Routing", "NAT", and "ADSL". The "Firewall" sub-option is selected, and the main content area displays the following configuration options:

- Firewall: Enabled Disabled
- SPI: Enabled Disabled

A warning message is displayed below the SPI option: "(WARNING: If You enabled SPI, all traffics initiated from WAN would be blocked, including DMZ, Virtual Server, and ACL WAN side.)"

At the bottom of the configuration area, there are two buttons: "SAVE" and "CANCEL".

4.5 Access Management

4.5.1 ACL

Access Control List (ACL) defines the rule which the user may remote access the route to execute the selected application. Go to **Access Management** → **ACL**, it will list that the five applications. With the default IP 0.0.0.0, any client of LAN site would be allowed to access the router. It means that any access through WAN interface is not allowed.

The screenshot shows the Micronet ADSL Router web interface. The top navigation bar includes 'Access Management', 'Quick Start', 'Interface Setup', 'Advanced Setup', 'Access Management', 'Maintenance', 'Status', and 'Help'. The 'Access Management' section is expanded to show 'ACL', 'Filter', 'SNMP', 'UPnP', and 'DDNS'. The 'ACL' sub-section is active, displaying 'Access Control Setup' and 'Access Control Editing' options. The 'Access Control Editing' section contains the following configuration fields:

- ACL: Activated Deactivated
- ACL Rule Index: 1
- Active: Yes No
- Secure IP Address: 0.0.0.0 ~ 0.0.0.0 (0.0.0.0 ~ 0.0.0.0 means all IPs)
- Application: Web
- Interface: Both

Below the configuration fields is a table with the following columns: Index, Active, Secure IP Address, Application, and Interface. At the bottom of the page are three buttons: SAVE, DELETE, and CANCEL.

4.5.2 IP Filtering

Go to **Access Management** → **IP Filtering** to block some packets from WAN.

The router provides extensive firewall protection by restricting connection parameters to reduce the risk of intrusion and defending against a wide array of common hacker attacks.

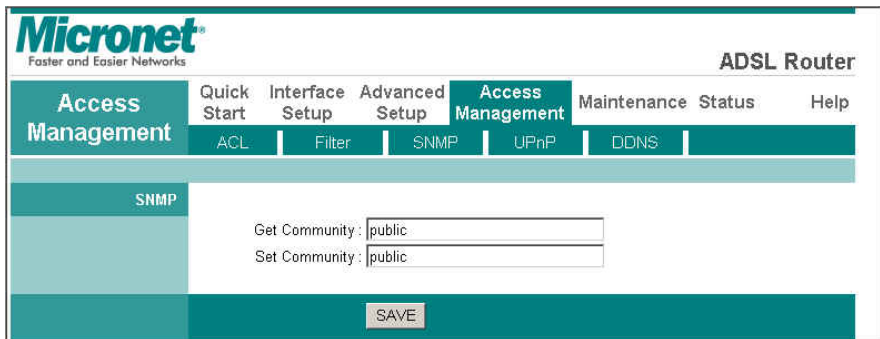

It will accept up to 12 IP Filter rules to prevent unwanted access from accessing the services of the router.

The screenshot displays the Micronet ADSL Router web interface. The top navigation bar includes 'Access Management', 'Quick Start', 'Interface Setup', 'Advanced Setup', 'Access Management', 'Maintenance', 'Status', and 'Help'. Under 'Access Management', there are sub-menus for 'ACL', 'Filter', 'SNMP', 'UPnP', and 'DDNS'. The 'Filter' sub-menu is selected, and the 'IP / MAC Filter Rule Editing' section is active. The configuration fields are as follows:

- Filter Type:** Filter Type Selection: IP / MAC Filter
- IP / MAC Filter Set Editing:** IP / MAC Filter Set Index: 1, Interface: PVC0, Direction: Both
- IP / MAC Filter Rule Editing:** IP / MAC Filter Rule Index: 1, Rule Type: IP, Active: Yes No
- Source IP Address:** (0.0.0.0 means Don't care)
- Subnet Mask:**
- Port Number:** 0 (0 means Don't care)
- Destination IP Address:** (0.0.0.0 means Don't care)

4.5.2 SNMP

The **Simple Network Management Protocol (SNMP)** enables a host computer to access configuration, performance and other system data that resides in a database on the modem. The host computer is called a *management station* and the modem is called an *SNMP agent*. The data that can be accessed via SNMP is stored in a *Management Information Database (MIB)* on the modem.

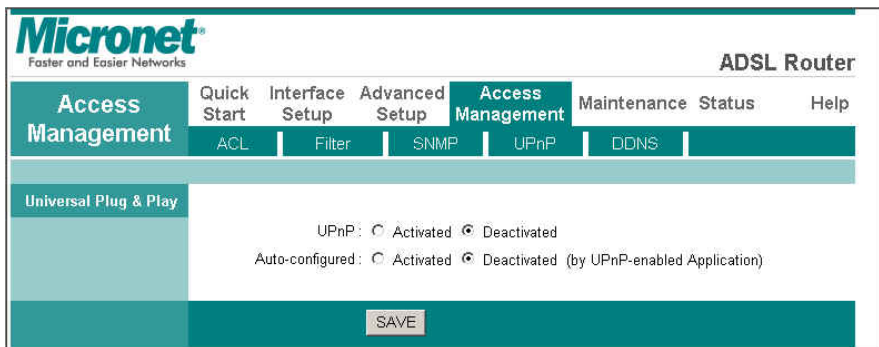

The screenshot shows the Micronet ADSL Router configuration interface. The top navigation bar includes 'Access Management', 'Quick Start', 'Interface Setup', 'Advanced Setup', 'Access Management', 'Maintenance', 'Status', and 'Help'. Under 'Access Management', there are sub-menus for 'ACL', 'Filter', 'SNMP', 'UPnP', and 'DDNS'. The 'SNMP' sub-menu is selected, showing a configuration page with two text input fields: 'Get Community : public' and 'Set Community : public'. A 'SAVE' button is located at the bottom of the page.

Note: Every time you change a setting, you must click APPLY button once to save the setting.

4.5.3 UPnP

Universal Plug and Play (UPnP): When a user plugs a device which supports UPnP into the network, the device will configure itself, acquire a TCP/IP address, and use a discovery protocol based on the Internet's Hypertext Transfer Protocol (HTTP) to announce its presence on the network to other devices.

You can choose “**Activated**” or “**Deactivated**” option from this session.

The screenshot shows the Micronet ADSL Router configuration interface. The top navigation bar includes 'Access Management', 'Quick Start', 'Interface Setup', 'Advanced Setup', 'Access Management', 'Maintenance', 'Status', and 'Help'. The 'Access Management' section is expanded to show 'ACL', 'Filter', 'SNMP', 'UPnP', and 'DDNS'. The 'UPnP' sub-section is selected, displaying the 'Universal Plug & Play' settings. The 'UPnP' option is set to 'Deactivated' (indicated by a checked radio button), and the 'Auto-configured' option is also set to 'Deactivated (by UPnP-enabled Application)'. A 'SAVE' button is located at the bottom of the configuration area.

Auto-Configured (by UPnP Application): Choose “**Activated**” option to allow UPnP-enabled applications to automatically configure the router so that they can communicate through the router, for example by using NAT traversal, UPnP applications automatically reserve a NAT forwarding port in order to communicate with another UPnP enabled device; this eliminates the need to manually configure port forwarding for the UPnP enabled application. If you don't want to make configuration changes through UPnP, just choose “**Deactivated**”. **Click Apply to save the setting to the router.**

Note: Every time you change a setting, you must click APPLY button once to save the setting.

4.5.4 DDNS

Go to **Access Management** → **DDNS** to set up your DDNS parameters.

Dynamic DNS (DDNS) allows you to update your dynamic IP address with the dynamic DNS services. So anyone can access your FTP or Web service on your computer using DNS-like address.

The screenshot shows the configuration page for Dynamic DNS on a Micronet ADSL Router. The page has a teal header with the Micronet logo and the text "Faster and Easier Networks" on the left, and "ADSL Router" on the right. Below the header is a navigation menu with tabs for "Access Management", "Quick Start", "Interface Setup", "Advanced Setup", "Access Management", "Maintenance", "Status", and "Help". Under "Access Management", there are sub-tabs for "ACL", "Filter", "SNMP", "UPnP", and "DDNS". The "DDNS" sub-tab is selected, and the page content is titled "Dynamic DNS".

Dynamic DNS: Activated Deactivated
Service Provider: www.dyndns.org
My Host Name:
E-mail Address:
Username:
Password:
Wildcard support: Yes No

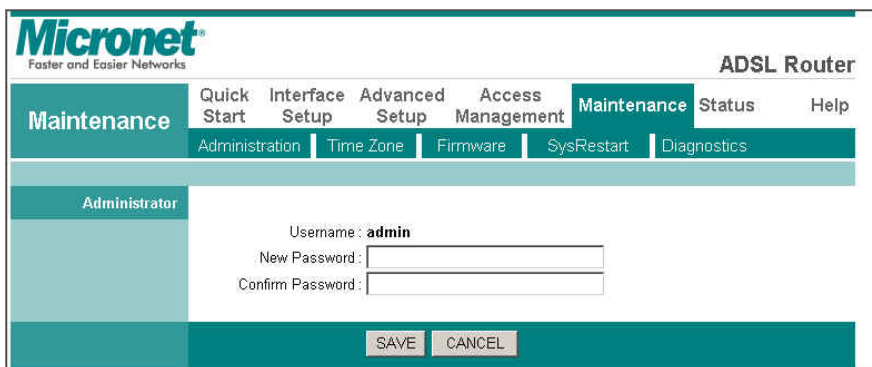

SAVE

4.6 Maintenance

4.6.1 Administration

Go to **Maintenance** → **Administration** to set a new user's name and password to restrict management access to the router.

The default is **admin** (User's name) and **admin** (Password)

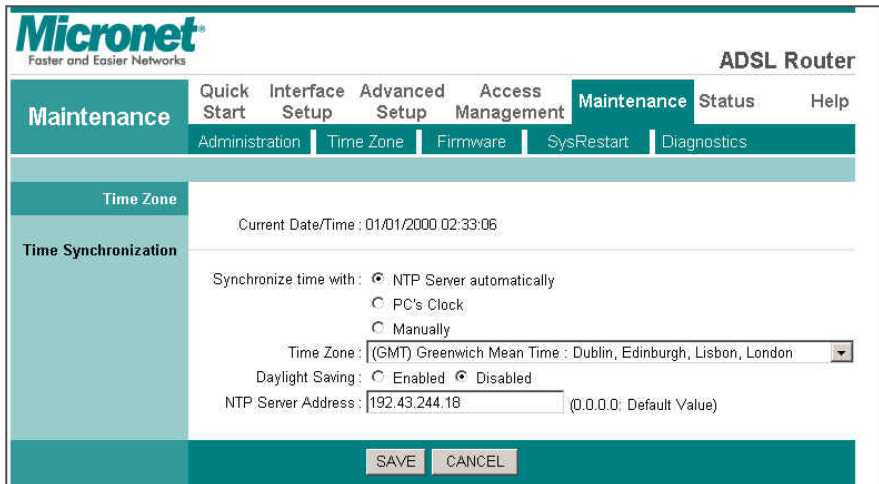

The screenshot shows the Micronet ADSL Router web interface. The top left features the Micronet logo with the tagline "Faster and Easier Networks". The top right displays "ADSL Router". A navigation menu includes "Quick Start", "Interface Setup", "Advanced Setup", "Access Management", "Maintenance", "Status", and "Help". The "Maintenance" menu is expanded to show "Administration", "Time Zone", "Firmware", "SysRestart", and "Diagnostics". The "Administration" page is titled "Administrator" and contains the following fields:

- Username: **admin**
- New Password:
- Confirm Password:

At the bottom of the form are "SAVE" and "CANCEL" buttons.

4.6.2 Time Zone

Go to **Maintenance** → **Time Zone** and select system time for your area.

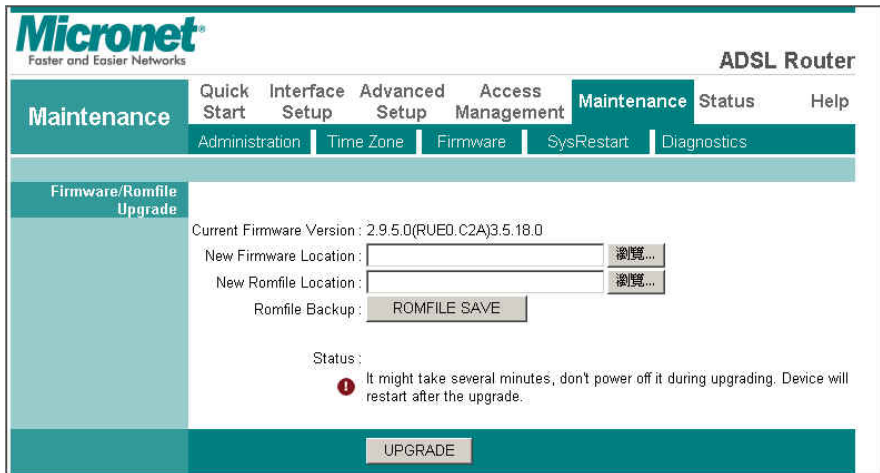

The screenshot shows the Micronet ADSL Router web interface. The top navigation bar includes 'Quick Start', 'Interface Setup', 'Advanced Setup', 'Access Management', 'Maintenance', 'Status', and 'Help'. The 'Maintenance' menu is expanded, showing 'Administration', 'Time Zone', 'Firmware', 'SysRestart', and 'Diagnostics'. The 'Time Zone' page displays the current date and time as '01/01/2000 02:33:06'. Under 'Time Synchronization', there are three radio button options: 'NTP Server automatically' (selected), 'PC's Clock', and 'Manually'. A dropdown menu for 'Time Zone' is set to '(GMT) Greenwich Mean Time : Dublin, Edinburgh, Lisbon, London'. The 'Daylight Saving' option is set to 'Disabled'. The 'NTP Server Address' is '192.43.244.18' with '(0.0.0.0: Default Value)' in parentheses. 'SAVE' and 'CANCEL' buttons are at the bottom.

Connecting to a Simple Network Time Protocol (SNTP) server allows the router to synchronize the system clock to the global Internet.

The synchronized clock in the router is used to record the security log and control client filtering.

4.6.3 Firmware Update

Go to **Maintenance** → **Firmware** to upgrade the firmware. The new firmware for this router can improve functionality and performance. Enter the path and name of the upgrade file then click the **UPGRADE** button below. You will be prompted to confirm the upgrade.

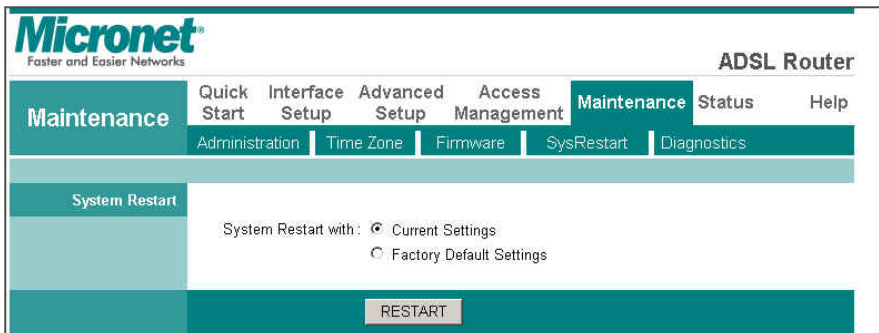

The screenshot shows the web interface of a Micronet ADSL Router. The top navigation bar includes 'Maintenance', 'Status', and 'Help'. Under 'Maintenance', there are sub-menus for 'Administration', 'Time Zone', 'Firmware', 'SysRestart', and 'Diagnostics'. The 'Firmware/Romfile Upgrade' section is active, displaying the current firmware version as 2.9.5.0(RUE0.C2A)3.5.18.0. It provides input fields for 'New Firmware Location' and 'New Romfile Location', each with a '浏览...' (Browse) button. A 'Romfile Backup' button labeled 'ROMFILE SAVE' is also present. A status message with a warning icon states: 'It might take several minutes, don't power off it during upgrading. Device will restart after the upgrade.' At the bottom, there is a large 'UPGRADE' button.

4.6.4 System Restart

In the event that the router stops responding correctly or in some way stops functioning, you can perform a reset. Your settings will not be changed.

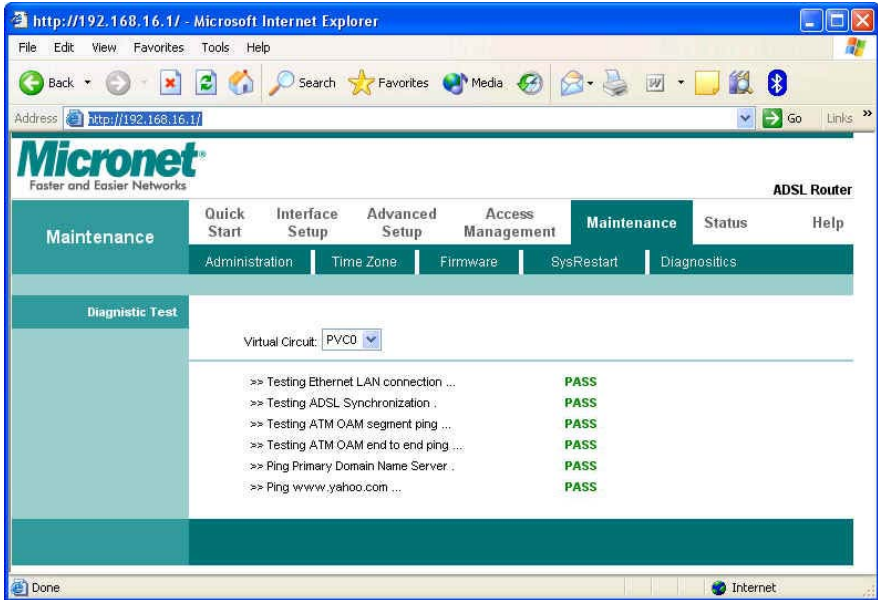

To perform the reset, select **Current Setting** and click on the **RESTART** button below. The router will reboot with current setting.

Select **Factory Default Setting**, and click on the **RESTART** button; the router will reboot with factory settings in default.

4.6.5 Diagnostic

The **Diagnostic** page allows you to run a series of diagnostic tests of your system software and hardware connections. From the **Virtual Circuit** drop-down list, select the name of the Virtual Circuit on which the diagnostics are to be shown.

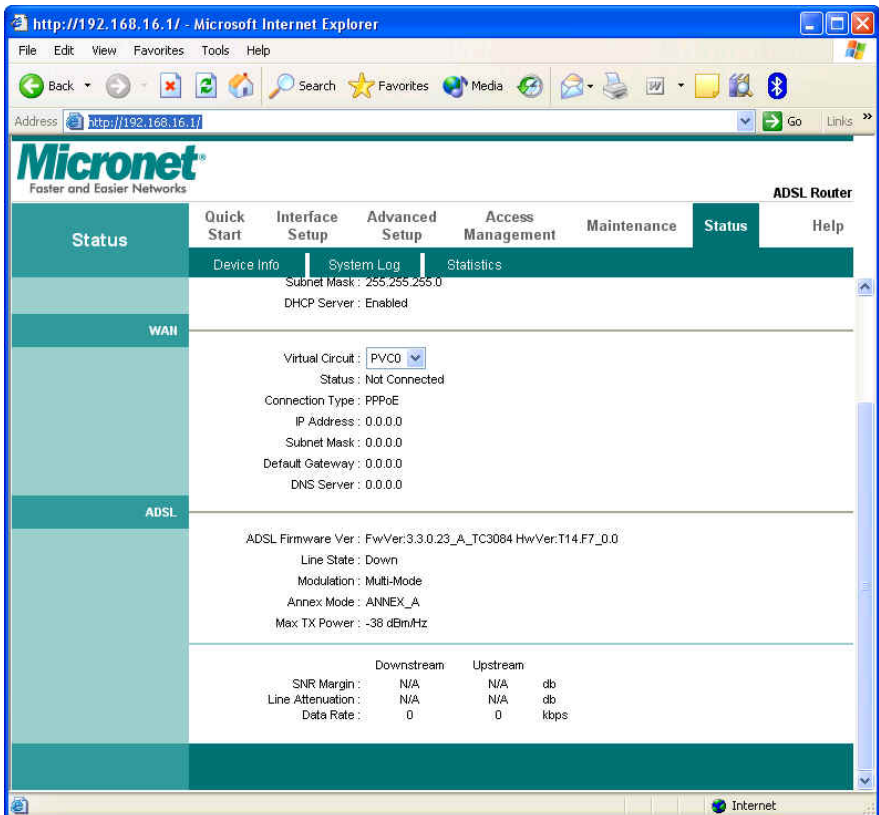

Note: 1) User ONLY can view PVC0's Diagnostic Test connection.

- 2) "Testing ADSL Synchronization" might take 30 sec to pass the Diagnostic Test.

4.7 Status

4.7.1 Device Info

The **Device Info** screen shows the current status of this modem router. Note that these fields are read-only and are not meant for diagnostic purposes, except the Virtual Circuit, which is chosen from drop-down list for showing the system status.

[Device Information]

Firmware Version: This field displays current firmware version.

MAC Address: The MAC (Media Access Control) or Ethernet address unique to your modem.

[LAN]

IP Address: The LAN port IP address

Subnet Mask: The LAN port IP subnet mask.

DHCP Server: The status of **DHCP** Server (Enabled or Disabled)

[WAN]

Virtual Circuit: Click the drop-down list and select the name of the Virtual Circuit on which the system status is to be shown.

Status: Connected or Not Connected

Connection Type: The WAN Connection Type.

IP Address: The WAN port IP address

Subnet Address: The WAN port IP subnet mask.

Default Gateway: The IP address of the default gateway, if applicable.

DNS Server: The IP address of the DNS Server

[ADSL]

ADSL Firmware Version: This field displays current ADSL firmware version.

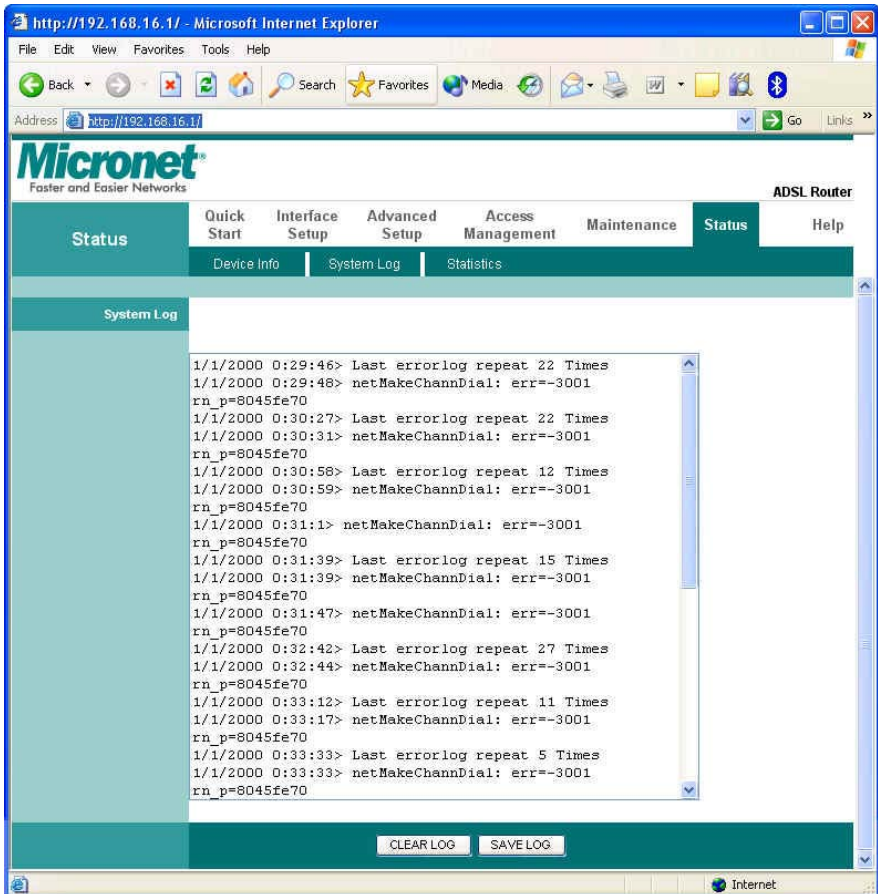

Line Status: This is the status of your WAN Line.

Modulation: The type of the modulation.

Annex Mode: The type of Annex mode.

4.7.2 System Log

Go to **Status** → **System Log** and you will see the system log file. Click **Save Log** to save system log file.

4.7.3 ADSL Statistics

Go to **Status** → **Statistics** and select ADSL interface. You can see the traffic statistics of ADSL interface.

The screenshot shows the Micronet ADSL Router web interface. The top navigation bar includes 'Quick Start', 'Interface Setup', 'Advanced Setup', 'Access Management', 'Maintenance', 'Status', and 'Help'. The 'Status' menu is expanded, showing 'Device Info', 'System Log', and 'Statistics'. The 'Statistics' page is active, displaying 'Traffic Statistics' for the ADSL interface. The interface selection is set to 'ADSL'. A table shows transmit and receive statistics for the ADSL interface.

Micronet[®]
Faster and Easier Networks

ADSL Router

REFRESH

Chapter 5 Troubleshooting

1. The LAN LED on the front panel does not light up.

STEPS	CORRECTIVE ACTION
1	Check the Ethernet cable connections between your ADSL2+ Router and the computer or hub.
2	Check for faulty Ethernet cables.
3	Make sure your computer's Ethernet card is working properly.
4	If these steps fail to correct the problem, contact your local distributor for assistance.

2. The ADSL LED on the front panel does not light up.

STEPS	CORRECTIVE ACTION
1	Check the telephone wire and connections between ADSL2+ Router DSL port and the wall jack.
2	Make sure that the telephone company has checked your phone line and set it up for DSL service.
3	Reset your ADSL line to reinitialize your link to the DSLAM.
4	If these steps fail to correct the problem, contact your local distributor for assistance.

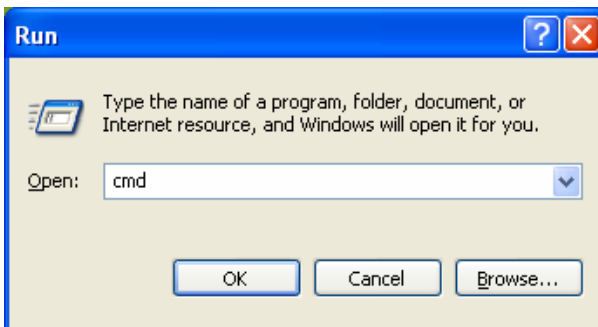

3. I cannot access the web management.

STEPS	CORRECTIVE ACTION
1	Make sure you are using the correct IP address of ADSL2+ Router. Check the IP address of ADSL2+ Router.
2	Your computer and ADSL2+ Router's IP addresses must be on the same subnet for LAN access.
3	If you have changed ADSL2+ Router's LAN IP address, then enter the new one as the URL.

The following procedures will help you to check the current IP Address setting of your computer. You can compare if your computer and router's IP Addresses are in the same subnet.

Step 1: Click "Start" and select "Run".

Step 2: Type in "cmd" and click "OK".

Step 3: Type ipconfig /all and click enter.

```

C:\WINDOWS\system32\cmd.exe
Microsoft Windows XP [Version 5.1.2600]

on
    Physical Address. . . . . : 00-00-E2-82-C3-AD
    Dhcp Enabled. . . . . : No
    IP Address. . . . . : 192.168.2.111
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . :

C:\Documents and Settings\Test>

```

- Your PC's IP address is 192.168.2.111.
- The PC's Subnet Mask is 255.255.255.0.
- Your PC's MAC Address is the one entitled Physical Address (00-00-E2-82-C3-AD).

4. I cannot access the Web Management of the router after activating the ACL function.

STEPS	CORRECTIVE ACTION
1	When ACL is activated, you have to set the ACL rule for allowing some users to use some services. Check if you have set the rules. If not, all the users are forbidden using any of service from LAN or WAN.
2	If you cannot access the Web Management of the router, please press the Reset button over 5 seconds to restore to defaults.
3	After the router is restarting, log in the router with the default IP Address 192.168.2.1.

5. I forget my login username and/or password.

STEPS	CORRECTIVE ACTION
1	If you have changed the password and have now forgotten it, you will need to upload the default configuration file. This will erase all custom configurations and restore all of the factory defaults including the password.
2	Press the Reset button for five seconds, and then release it. When the LAN LED begins to blink, the defaults have been restored.
3	The default username is "admin". The default password is "admin". The Password and Username fields are case-sensitive. Make sure that you enter the correct password and username using the proper casing.
4	It is highly recommended to change the default username and password. Make sure you store the username and password in a safe place.

6. Internet connection disconnects.

STEPS	CORRECTIVE ACTION
1	Check the schedule rules.
2	If you use PPPoA or PPPoE encapsulation, check the idle time-out setting.
3	Contact your ISP.

7. Initialization of the ADSL connection failed.

STEPS	CORRECTIVE ACTION
1	Check the cable connections between the ADSL port and the wall jack. The ADSL LED on the rear panel of the router should be on.
2	Check VPI, VCI, type of encapsulation and type of multiplexing settings are the same as what you collected from your ISP.
3	Restart the router. If you still have problems, you may need to verify your VPI, VCI, type of encapsulation and type of multiplexing settings with the ISP.

8. I cannot get a WAN IP address from the ISP.

STEPS	CORRECTIVE ACTION
1	The ISP provides the WAN IP address after authenticating you. Authentication may be through the user name and password, the MAC address or the host name.
2	The username and password apply to PPPoE and PPOA encapsulation only. Make sure that you have entered the correct Service Type, User Name and Password (be sure to use the correct casing).

Appendix A Glossary

Address mask

A bit mask used to select bits from an Internet address for subnet addressing. The mask is 32 bits long and selects the network portion of the Internet address and one or more bits of the local portion. Sometimes is called subnet mask.

AAL5

ATM Adaptation Layer - This layer maps higher layer user data into ATM cells, making the data suitable for transport through the ATM network.

ADSL

Asymmetric digital subscriber line

ATM

Asynchronous Transfer Mode - A cell-based data transfer technique in which channel demand determines packet allocation. ATM offers fast packet technology, real time, demand led switching for efficient use of network resources.

AWG

American Wire Gauge - The measurement of thickness of a wire

Bridge

A device connects two or more physical networks and forwards packets between them. Bridges can usually be made to filter packets, that is, to forward only certain traffic. Related devices are: repeaters which simply forward electrical signals from one cable to the other, and full-fledged routers which make routing decisions based on several criteria.

Broadband

Characteristic of any network multiplexes independent network carriers onto a single cable. Broadband technology allows several networks to coexist on one single cable; traffic from one network does not interfere with traffic from another. Broadcast A packet delivery system where a copy of a

given packet is given to all hosts attached to the network. Example: Ethernet.

CO

Central Office. Refers to equipment located at a Telco or service provider's office.

CPE

Customer Premises Equipment located in a user's premises

DHCP (Dynamic Host Configuration Protocol)

DHCP is software that automatically assigns IP addresses to client stations logging onto a TCP/IP network. DHCP eliminates having to manually assign permanent IP addresses to every device on your network. DHCP software typically runs in servers and is also found in network devices such as Routers.

DMT

Discrete Multi-Tone frequency signal modulation

Downstream rate

The line rate for return messages or data transfers from the network machine to the user's premises machine.

DSLAM

Digital Subscriber Line Access Multiplex

Dynamic IP Addresses

A dynamic IP address is an IP address that is automatically assigned to a client station (computer, printer, etc.) in a TCP/IP network. Dynamic IP addresses are typically assigned by a DHCP server, which can be a computer on the network or another piece of hardware, such as the Router. A dynamic IP address may change every time your computer connects to the network.

Encapsulation

The technique used by layered protocols in which a layer adds header information to the protocol data unit (PDU) from the layer above. As an example, in Internet terminology, a packet would contain a header from the physical layer, followed by a header from the network layer (IP), followed by a header from the transport layer (TCP), followed by the application protocol data.

Ethernet

One of the most common local area network (LAN) wiring schemes, Ethernet has a transmission rate of 10 Mbps.

FTP

File Transfer Protocol. The Internet protocol (and program) used to transfer files between hosts.

Hop count

A hop count is a measure of distance between two points on the Internet. It is equivalent to the number of gateways that separate the source and destination.

HTML

Hypertext Markup Language - The page-coding language for the World Wide Web.

HTML browser

A browser used to traverse the Internet, such as Netscape or Microsoft Internet Explorer.

http

Hypertext Transfer Protocol - The protocol used to carry world-wide-web (www) traffic between a www browser computer and the www server being accessed.

ICMP

Internet Control Message Protocol - The protocol used to handle errors and control messages at the IP layer. ICMP is actually part of the IP protocol.

Internet address

An IP address is assigned in blocks of numbers to user organizations accessing the Internet. These addresses are established by the United States Department of Defense's Network Information Center. Duplicate addresses can cause major problems on the network, but the NIC trusts organizations to use individual addresses responsibly. Each address is a 32-bit address in the form of x.x.x.x where x is an eight-bit number from 0 to 255. There are three classes: A, B and C, depending on how many computers on the site are likely to be connected.

Internet Protocol (IP)

The network layer protocol for the Internet protocol suite

IP address

The 32-bit address assigned to hosts that want to participate in a TCP/IP Internet.

ISP

Internet service provider - A company allows home and corporate users to connect to the Internet.

MAC

Media Access Control Layer - A sub-layer of the Data Link Layer (Layer 2) of the ISO OSI Model responsible for media control.

MIB

Management Information Base - A collection of objects can be accessed via a network management protocol, such as SNMP and CMIP (Common Management Information Protocol).

NAT

Network Address Translation - A proposal for IP address reuse, where the local IP address is mapped to a globally unique address.

NVT

Network Virtual Terminal

PAP

Password Authentication Protocol

PORT

The abstraction used by Internet transport protocols to distinguish among multiple simultaneous connections to a single destination host.

POTS

Plain Old Telephone Service - This is the term used to describe basic telephone service.

PPP

Point-to-Point-Protocol - The successor to SLIP, PPP provides router-to-router and host-to-network connections over both synchronous and asynchronous circuits.

PPPoE

PPP over Ethernet is a protocol for connecting remote hosts to the Internet over an always-on connection by simulating a dial-up connection.

Remote server

A network computer allows a user to log on to the network from a distant location.

RFC

Request for Comments - Refers to documents published by the Internet Engineering Task Force (IETF) proposing standard protocols and procedures for the Internet. RFCs can be found at www.ietf.org.

Route

The route is the path that network traffic takes from its source to its destination. The route a datagram may follow can include many gateways and many physical networks. In the Internet, each datagram is routed separately.

Router

A system responsible for making decisions about which of several paths network (or Internet) traffic will follow. To do this, it uses a routing protocol to gain information about the network and algorithms to choose the best route based on several criteria known as "routing metrics".

Routing table

Information stored within a router that contains network path and status information. It is used to select the most appropriate route to forward information along.

Routing Information Protocol (RIP)

Routers periodically exchange information with one another so that they can determine minimum distance paths between sources and destinations.

SNMP

Simple Network Management Protocol - The network management protocol of choice for TCP/IP-based Internet.

SOCKET

(1) The Berkeley UNIX mechanism for creating a virtual connection between processes.

(2) IBM term for software interfaces that allow two UNIX application programs to talk via TCP/IP protocols.

Spanning-Tree Bridge Protocol (STP)

Spanning-Tree Bridge Protocol (STP) - Part of an IEEE standard. A mechanism for detecting and preventing loops from occurring in a

multi-bridged environment. When three or more LAN's segments are connected via bridges, a loop can occur. Because a bridge forwards all packets that are not recognized as being local, therefore some packets may circulate for long periods of time, eventually degrading system performance. This algorithm ensures only one path connects any pair of stations, selecting one bridge as the 'root' bridge, with the highest priority one as identifier, from which all paths should radiate.

Spoofing

A method of fooling network end stations into believing that keep alive signals have come from and returned to the host. Polls are received and returned locally at either end.

Static IP Addresses

A static IP address is an IP address permanently assigned to computer in a TCP/IP network. Static IP addresses are usually assigned to networked devices that are consistently accessed by multiple users, such as Server PCs, or printers. If you are using your Router to share your cable or DSL Internet connection, contact your ISP to see if they have assigned your home a static IP address. You will need that address during your Router's configuration.

Subnet

For routing purposes, IP networks can be divided into logical subnets by using a subnet mask. Values below those of the mask are valid addresses on the subnet.

TCP

Transmission Control Protocol - The major transport protocol in the Internet suite of protocols provides reliable, connection-oriented full-duplex streams.

TFTP

Trivial File Transfer Protocol - A simple file transfer protocol (a simplified version of FTP) that is often used to boot diskless workstations and other network devices such as routers over a network (typically a LAN).

Telnet

The virtual terminal protocol in the Internet suite of protocols - Allows users of one host to log into a remote host and act as normal terminal users of that host.

Transparent bridging

The intelligence necessary for making relaying decisions exists in the

bridge itself; the bridge is thus transparent to the communicating workstations. It involves frame forwarding, learning workstation addresses and ensuring no topology loops exist (in conjunction with the Spanning-Tree algorithm).

UDP

User Datagram Protocol - A connectionless transport protocol that runs on top of TCP/IP's IP. UDP, like TCP, uses IP for delivery; however, unlike TCP, UDP provides for exchange of datagrams without acknowledgments or guaranteed delivery. Best suited for small, independent requests, such as requesting a MIB value from an SNMP agent, in which first setting up a connection would take more time than sending the data.

UNI signaling

User Network Interface signaling for ATM communications.

Virtual Connection (VC)

A link that seems and behaves like a dedicated point-to-point line or a system that delivers packets in sequence, as happens on an actual point-to-point network. In reality, the data is delivered across a network via the most appropriate route. The sending and receiving devices do not have to be aware of the options and the route is chosen only when a message is sent. There is no pre-arrangement, so each virtual connection exists only for the duration of that one transmission.

WAN

Wide area network - A data communications network that spans any distance and is usually provided by a public carrier (such as a telephone company or service provider).

Appendix B Cabling

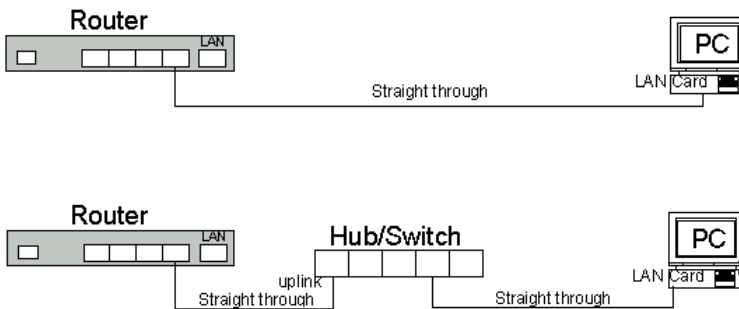

Network cables connect PCs in an Ethernet network Category 5, also called "Cat5" for short, which is a commonly used type of network cable today.

Cat 5 cables are tipped with RJ-45 connectors, which fit into RJ-45 port.

Straight-through vs. Crossover Cables:

LAN Connection:

Check to see the LEDs light up after you connected two pieces of hardware.

Appendix C Service / Port

Service Name, Protocol and Port number

Service	Protocol	Port	Service	Protocol	Port
