A Important Safety Instructions

- 1. Read and follow all warning notices and instructions marked on the product or included in the manual.
- 2. Slots and openings in the cabinet are provided for ventilation. To ensure reliable operation of the product and to protect it from overheating, these slots and openings must not be blocked or covered.
- 3. Do not allow anything to rest on the power cord and do not locate the product where persons will walk on the power cord.
- 4. Do not attempt to service this product yourself, as opening or removing covers may expose you to dangerous high voltage points or other risks. Refer all servicing to qualified service personnel.
- General purpose cables are used with this product for connection to the network. Special cables, which may be required by the regulatory inspection authority for the installation site, are the responsibility of the customer. Use a UL Listed, CSA certified, minimum No. 24 AWG line cord for connection to the Digital Subscriber Line (DSL) network.
- 6. When installed in the final configuration, the product must comply with the applicable Safety Standards and regulatory requirements of the country in which it is installed. If necessary, consult with the appropriate regulatory agencies and inspection authorities to ensure compliance.
- 7. A rare phenomenon can create a voltage potential between the earth grounds of two or more buildings. If products installed in separate buildings are interconnected, the voltage potential may cause a hazardous condition. Consult a qualified electrical consultant to determine whether or not this phenomenon exists and, if necessary, implement corrective action prior to interconnecting the products.
- Input power to this product must be provided by one of the following: (1) a UL Listed/CSA certified power source with a Class 2 or Limited Power Source (LPS) output for use in North America, or (2) a certified transformer, with a Safety Extra Low Voltage (SELV) output having a maximum of 240 VA available, for use in the country of installation.
- 9. In addition, since the equipment is to be used with telecommunications circuits, take the following precautions:
 - Never install telephone wiring during a lightning storm.
 - Never install telephone jacks in wet locations unless the jack is specifically designed for wet locations.
 - Never touch uninsulated telephone wires or terminals unless the telephone line has been disconnected at the network interface.
 - Use caution when installing or modifying telephone lines.
 - Avoid using a telephone (other than a cordless type) during an electrical storm. There may be a remote risk of
 electric shock from lightning.
 - Do not use the telephone to report a gas leak in the vicinity of the leak.

CE Marking

When the product is marked with the CE mark on the equipment label, a supporting Declaration of Conformity may be downloaded from the Paradyne World Wide Web site at **www.paradyne.com**. Select *Library* \rightarrow *Technical Manuals* \rightarrow *CE Declarations of Conformity.*

FCC Part 15 Declaration

An FCC Declaration of Conformity may be downloaded from the Paradyne World Wide Web site at www.paradyne.com. Select Support -> Technical Manuals -> Declarations of Conformity.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

The authority to operate this equipment is conditioned by the requirement that no modifications will be made to the equipment unless the changes or modifications are expressly approved by the responsible party.

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Notice to Users of the United States Telephone Network

The following notice applies to versions of the modem that have been FCC Part 68 approved.

This equipment complies with Part 68 of the FCC rules and the requirements adopted by the Administrative Council for Terminal Attachment (ACTA). On the bottom side of this equipment is a label that contains, among other information, a product identifier in the format US:AAAEQ##TXXXX. If requested, this number must be provided to the Telephone Company.

This equipment is intended to connect to the Public Switched Telephone Network through a Universal Service Order Code (USOC) type RJ11C jack. A plug and jack used to connect this equipment to the premises wiring and telephone network must comply with the applicable FCC Part 68 rules and requirements adopted by the ACTA. A compliant telephone cord and modular plug is provided with this product. It has been designed to be connected to a compatible modular jack that is also compliant.

The Ringer Equivalence Number (or REN) is used to determine the number of devices that may be connected to a telephone line. Excessive RENs on a telephone line may result in the devices not ringing in response to an incoming call. In most but not all areas, the sum of RENs should not exceed five (5.0). To be certain of the number of devices that may be connected to a line, as determined by the total RENs, contact the local Telephone Company. The REN for this product is part of the product identifier that has the format US:AAAEQ##TXXXX. The digits represented by ## are the REN without a decimal point. For example, 03 represents a REN of 0.3.

If the modem causes harm to the telephone network, the Telephone Company will notify you in advance that temporary discontinuance of service may be required. But if advance notice is not practical, the Telephone Company will notify the customer as soon as possible. Also, you will be advised of your right to file a complaint with the FCC if you believe it is necessary.

The Telephone Company may make changes in its facilities, equipment, operations or procedures that could affect the operation of the equipment. If this happens, the Telephone Company will provide advance notice in order for you to make necessary modifications to maintain uninterrupted service. If trouble is experienced with the modem, refer to the repair and warranty information in this document.

If the equipment is causing harm to the telephone network, the Telephone Company may request that you disconnect the equipment until the problem is resolved.

The user may make no repairs to the equipment.

Connection to party line service is subject to state tariffs. Contact the state public utility commission, public service commission or corporation commission for information.

If the site has specially wired alarm equipment connected to the telephone line, ensure the installation of the modem does not disable the alarm equipment. If you have questions about what will disable alarm equipment, consult your Telephone Company or a qualified installer.

Notice to Users of the Canadian Telephone Network

NOTICE: This equipment meets the applicable Industry Canada Terminal Equipment Technical Specifications. This is confirmed by the registration number. The abbreviation IC before the registration number signifies that registration was performed based on a Declaration of Conformity indicating that Industry Canada technical specifications were met. It does not imply that Industry Canada approved the equipment.

NOTICE: The Ringer Equivalence Number (REN) for this terminal equipment is labeled on the equipment. The REN assigned to each terminal equipment provides an indication of the maximum number of terminals allowed to be connected to a telephone interface. The termination on an interface may consist of any combination of devices subject only to the requirement that the sum of the Ringer Equivalence Numbers of all the devices does not exceed five.

If your equipment is in need of repair, contact your local sales representative, service representative, or distributor directly.

A CANADA - EMI NOTICE:

This Class B digital apparatus meets all requirements of the Canadian interference-causing equipment regulations.

Cet appareil numérique de la classe B respecte toutes les exigences du règlement sur le matérial brouilleur du Canada.

Japan Notices

この装置は、情報処理装置等電波障害自主規制協議会(VCCI)の基準 に基づくクラスB情報技術装置です。この装置は、家庭環境で使用すること を目的としていますが、この装置がラジオやテレビジョン受信機に近接して 使用されると、受信障害を引き起こすことがあります。 取扱説明書に従って正しい取り扱いをして下さい。

This is a Class B product based on the standard of the Voluntary Control Council for Interference from Information Technology Equipment (VCCI). If this is used near a radio or television receiver in a domestic environment, it may cause radio interference. Install and use the equipment according to the instruction manual.

Introduction

1

Introduction

Congratulations on becoming the owner of a 6211 ADSL router.

This User's Guide will show you how to set up the router, and how to customize its configuration to get the most out of this product.

Features

The 6211 router has the following features:

- Built-in ADSL modem which offers G.Dmt, G.lite, T1.413, ADSL2, Annex L, and ADSL2+ to meet different linking speeds from your ISP.
- 10/100BaseT Ethernet port to provide Internet connectivity to all computers on your LAN via additional Ethernet Switch/HUB.
- USB port allows quick installation.
- Built-in splitter provides you to connect telephone directly without using extra splitter (Model 6211-I1-x0x).
- Configuration program accessible via a web browser, such as Microsoft Internet Explorer.

System Requirements

In order to use the 6211 ADSL router for Internet access, you must have the following:

- ADSL service subscription from your ISP
- A PC with:
 - An Ethernet 10/100BaseT network interface card or USB port
 - A processor equivalent to or faster than a Pentium II 133 MHz
 - 32 MB RAM or greater
 - If USB drivers will be installed, 5 MB free disk space

Download from Www.Somanuals.com. All Manuals Search And Download.

- Windows 95b, 98, 98SE, 2000, ME, NT, or XP (Note: Windows 95 requires the installation of the Winsock program, not included. Windows 95 and 98 do not support USB.)
- (Optional) An Ethernet hub or switch, if you wish to connect the router to several computers on an Ethernet network.
- For system configuration using the supplied web-based program: a web browser such as Internet Explorer Version 6.0 or later. Netscape is not supported.

Parts List

In addition to this document, your 6211 ADSL router should come with the following:

- 6211 ADSL router
- Power adapter
- Ethernet cable (RJ45, straight-through type)
- Phone cable (RJ11)
- USB cable

Figure 1-1. 6211 ADSL Router Package Contents

Front Panel

The front panel contains LED indicators that show the status of the unit.

Figure 1-2. Front Panel LEDs

Label	Color	Function
POWER	Green	On: Unit is powered on
		Off: Unit is powered off
STATUS	Green	On: ADSL link is established and active
		Flashing: Trying to create an ADSL connection
		Off: No ADSL link
ACTIVITY	Green	Flashing: ADSL data transfer
LAN	Green	On: LAN link is established
		Flashing: Data transfer at LAN connection
		Off: No LAN link
USB	Green	On: USB link is established
		Off: No USB link

Rear Panel

The rear panel contains the ports for the router's data and power connections.

Label	Function
LINE	Connects to your ADSL line
PHONE (Model 6211-I1-x0x)	Connects to your telephone
USB	USB outlet, for PC USB port connection
LAN	Connects the CPE to your PC's Ethernet port, or to the uplink port on your LAN's hub or switch, using the cable provided
RESET/DEFAULT	To reset the router to its default settings
POWER	Connects to the supplied power adapter

Table 1-2. Rear Panel Labels and Connectors

Hardware Installation and PC Setup

Overview

This chapter provides basic instructions for connecting the router to a computer or a LAN and to the Internet using DSL. The first part provides instructions to set up the hardware, and the second part describes how to prepare your PC for use with the router.

It is assumed that you have already subscribed to DSL service with your Internet service provider (ISP).

Connecting the Hardware

Caution

Shut down your PC and any other equipment before connecting it to the router.

To connect your router:

Procedure

- 1. Connect your ADSL line to the port labeled LINE on the rear panel of the device.
- 2. For routers with a phone port (model numbers of the form 6211-I1-x0x), optionally connect your telephone to the port labeled PHONE.
- 3. Connect your PC or a LAN:
 - Use the supplied Ethernet cable to connect your PC directly to the router. Connect one end of the Ethernet cable to the port labeled LAN on the router and connect the other end to the Ethernet port of your computer.
 - Alternatively, use the supplied USB cable to connect your PC directly to the router. Connect one end of the USB cable to the port labeled USB on the router and connect the other end to a free USB port on your PC. Install the USB drivers as described in the user's guide on the CD.

- If your LAN has more than one computer, you can attach one end of an Ethernet cable to a hub or a switch and the other to the LAN port of the router. Either a crossover or straight-through Ethernet cable can be used.
- 4. Connect the AC power adapter to the POWER connector on the back of the device and plug the adapter into a wall outlet or power strip.

Figure 2-1. Hardware Installation

- 5. Turn on and boot up your PC and any LAN devices, such as hub or switches, and any computers connected to them.
- 6. Verify that the router's LEDs are illuminated as shown in Table 3 1.

Table 2-1.LED Indicators

This LED	Should be:
POWER	Solid green to indicate that the device is turned on. If this light is not on, check if the power adapter is attached to the router and plugged into an AC power source.
STATUS	Solid green to indicate that the router can communicate with your ISP via ADSL, or flashing when the router is trying to connect to your ISP.
ACTIVITY	Flashing when the device is sending or receiving data over the ADSL connection.
LAN	Solid green to indicate that the device can communicate with your PC via Ethernet, or flashing when the router is sending or receiving data over Ethernet.
USB	Solid green when connected, flashing when the router is sending or receiving data.

If the LEDs are illuminated as expected, the router is working properly.

Installing the USB Driver

The following section applies only if you use the USB connector on the router. If you connect the USB cable between your PC and the router, Windows detects the new hardware and the Found New Hardware Wizard appears on your PC monitor. Follow this procedure:

Procedure

1. Choose "Install from a list or <u>specific location</u>" from the Wizard's menu, then click on Next.

Figure 2-2. Found New Hardware Wizard

2. Insert the supplied CD ROM and use Browse to include the CD drive in the search.

€ ≦	earch for the best driver in these locations.
	e the check boxes below to limit or expand the default search, which includes lo ths and removable media. The best driver found will be installed.
pa	nan san an an an ann an an an an an an an an
2	Search removable media (floppy, CD-RIDM)
1	Include this location in the search:
	D:\ Browse
CD	on't search. I will choose the driver to install.
	cose this option to select the device driver from a list. Windows does not guarar a driver you choose will be the best match for your hardware.

Figure 2-3. Search and Installation Options

3. If the Wizard reports a compatibility issue, select "Continue Anyway". Installation of the USB driver proceeds.

Figure 2-4. Compatibility Warning

Figure 2-5. Progress Screen

4. When prompted, click on Finish to close the Wizard.

Figure 2-6. Completion Screen

Configuring Your Computer

Before you can access the router over the LAN or the USB port, you have to configure your PC's TCP/IP address to be 192.168.1.x (where x is any number between 3 and 254), with a subnet mask of 255.255.255.0. Your router's default IP address is 192.168.1.1.

Windows XP PCs

- 1. In the Windows task bar, click on the Start button, and then click on Control Panel.
- 2. Double-click on the Network Connections icon.
- In the LAN or High-Speed Internet window, right-click on the icon corresponding to your network interface card (NIC) or USB connection, and select Properties. (Often this icon is labeled Local Area Connection). The Local Area Connection dialog box displays with a list of currently installed network items.
- 4. Ensure that the check box to the left of the item labeled Internet Protocol (TCP/IP) is checked, and click on Properties.

Figure 2-9. TCP/IP Properties (Windows XP)

6. Click on OK twice to confirm your changes, and close the Control Panel.

Windows 2000 PCs

- 1. In the Windows task bar, click on the Start button, point to Settings, and then click on Control Panel.
- 2. Double-click on the Network and Dial-up Connections icon.
- 3. In the Network and Dial-up Connections window, right-click on the Local Area Connection icon, and then select Properties.

The Local Area Connection Properties dialog box display a list of currently installed network components. If the list includes Internet Protocol (TCP/IP), the protocol has already been enabled; skip to Step 10.

- 4. If Internet Protocol (TCP/IP) does not appear as an installed component, click on Install.
- 5. In the Select Network Component Type dialog box, select Protocol, and then click on Add.
- Select Internet Protocol (TCP/IP) in the Network Protocols list, and then click on OK.

You may be prompted to install files from your Windows 2000 installation CD or other medium. Follow the instructions to install the files.

- 7. If prompted, click on OK to restart your computer with the new settings.
- 8. After restarting your PC, double-click on the Network and Dial-up Connections icon in the Control Panel.
- 9. In Network and Dial-up Connections window, right-click on the Local Area Connection icon, and then select Properties.
- 10. In the Local Area Connection Properties dialog box, select Internet Protocol (TCP/IP), and then click on Properties.
- In the Internet Protocol (TCP/IP) Properties dialog box, click on the radio button labeled Use the following IP address. Type an address between 192.168.1.3 and 192.168.1.254 in the IP Address field and 255.255.255.0 in the Subnet Mask field.
- 12. Click on OK twice to confirm and save your changes, and then close the Control Panel.

Windows ME PCs

- 1. In the Windows task bar, click on the Start button, point to Settings, and then click on Control Panel.
- 2. Double-click on the Network and Dial-up Connections icon.
- 3. In the Network and Dial-up Connections window, right-click on the Network icon, and then select Properties.

The Network Properties dialog box displays a list of currently installed network components. If the list includes Internet Protocol (TCP/IP), the protocol has already been enabled; skip to Step 11.

- 4. If Internet Protocol (TCP/IP) does not appear as an installed component, click on Add.
- 5. In the Select Network Component Type dialog box, select Protocol, and then click on Add.
- 6. Select Microsoft in the Manufacturers box.
- 7. Select Internet Protocol (TCP/IP) in the Network Protocols list, and then click on OK.

You may be prompted to install files from your Windows Me installation CD or other media. Follow the instructions to install the files.

- 8. If prompted, click on OK to restart your computer with the new settings.
- 9. After restarting your PC, double-click on the Network and Dial-up Connections icon in the Control Panel.
- 10. In Network and Dial-up Connections window, right-click on the Network icon, and then select Properties.
- 11. In the Network Properties dialog box, select TCP/IP, and then click on Properties.
- In the TCP/IP Settings dialog box, click on the radio button labeled Use the following IP address. Type an address between 192.168.1.3 and 192.168.1.254 in the IP Address field and 255.255.255.0 in the Subnet Mask field.
- 13. Click on OK twice to confirm and save your changes, and then close the Control Panel.

Windows 95 and Windows 98 PCs

- 1. In the Windows task bar, click on the Start button, point to Settings, and then click on Control Panel.
- 2. Double-click on the Network icon.

The Network dialog box displays a list of currently installed network components. If the list includes TCP/IP, the protocol has already been enabled. Skip to step 9.

- 3. If TCP/IP does not appear as an installed component, click on Add. The Select Network Component Type dialog box appears.
- 4. Select Protocol, and then click on Add.

The Select Network Protocol dialog box appears.

- 5. Click on Microsoft in the Manufacturers list box, and then click on TCP/IP in the Network Protocols list box.
- 6. Click on OK to return to the Network dialog box, and then click on OK again.

You may be prompted to install files from your Windows 95/98 installation CD. Follow the instructions to install the files.

7. Click on OK to restart the PC and complete the TCP/IP installation.

- 8. After restarting your PC, open the Control Panel window, and then click on the Network icon.
- 9. Select the network component labeled TCP/IP, and then click on Properties.

If you have multiple TCP/IP listings, select the listing associated with your network card or adapter.

- 10. In the TCP/IP Properties dialog box, click on the IP Address tab.
- Click in the radio button labeled Use the following IP address. Type an address between 192.168.1.3 and 192.168.1.254 in the IP Address field and 255.255.255.0 in the Subnet Mask field.
- 12. Click on OK twice to confirm and save your changes. You will be prompted to restart Windows. Click on Yes.

Windows NT 4.0

- 1. In the Windows NT task bar, click on the Start button, point to Settings, and then click on Control Panel.
- 2. In the Control Panel window, double click on the Network icon.
- 3. In the Network dialog box, click on the Protocols tab.

The Protocols tab displays a list of currently installed network protocols. If the list includes TCP/IP, the protocol has already been enabled. Skip to Step 9.

- 4. If TCP/IP does not appear as an installed component, click on Add.
- 5. In the Select Network Protocol dialog box, select TCP/IP, and then click on OK.

You may be prompted to install files from your Windows NT installation CD or other medium. Follow the instructions to install the files.

After all files are installed, a window appears to inform you that a TCP/IP service called DHCP can be set up to dynamically assign IP information.

- 6. Click on Yes to continue, and then click on OK, if prompted, to restart your computer.
- 7. After restarting your PC, open the Control Panel window, and then double-click on the Network icon.
- 8. In the Network dialog box, click on the Protocols tab.
- 9. In the Protocols tab, select TCP/IP, and then click on Properties.
- In the Microsoft TCP/IP Properties dialog box, click on the radio button labeled Use the following IP address. Type an address between 192.168.1.3 and 192.168.1.254 in the IP Address field and 255.255.255.0 in the Subnet Mask field.
- 11. Click on OK twice to confirm and save your changes, and then close the Control Panel.

Logging in to Your Router

This section shows how to connect to the router's web interface, configure settings, and observe some statistics of your Internet connection.

1. Open your Web browser, and type the following URL in the address/location box, and press Enter:

http://192.168.1.1

This is the default IP address for the LAN port on the router.

A login screen appears.

Enter Netv	vork Passwor	d		<u>? ×</u>
? >	Please type yo	ur user name -	and password.	
۶U	Site:	192.168.1.1		
	Realm	DSL Router		
	<u>U</u> ser Name			
	<u>P</u> assword			
	🔲 <u>S</u> ave this p	assword in yo	ur password list	
			OK	Cancel

Figure 2-10. Login Screen

If you have problem connecting to the router, verify that your PC is properly configured within the subnet of the router's default IP address 192.168.1.1. Setup is described in *Configuring Your Computer* on page 2-7.

2. Enter your user name and password, and then click on OK to display the home page of the router's web interface. There are two default user name and password combinations:

 Table 2-2.
 Default User Names and Passwords

User Name	Password	Capability
user	user	Can display device status, but cannot change or save configuration options.
admin	admin	Can perform all functions.

You can change the passwords at any time.

The home page is shown in Figure 2-11.

ADSL BER Test

The ADSL Bit Error Rate (BER) test determines the quality of the ADSL connection. The test is performed by transferring idle cells containing a known pattern and comparing the received data with this known pattern to check for any errors (Figure 3-7 and Figure 3-8).

Procedure

To run a BER test:

- 1. Click on the ADSL BER Test button.
- 2. Select the test duration and click on Start
- 3. Check the result.

Figure 5-2. ATM PVC Configuration Screen

Verify the following values with your ISP before you change them.

- VPI (Virtual Path Identifier) The valid range is 0 to 255.
- VCI (Virtual Channel Identifier) The valid range is 32 to 65535.
- Service Category Five classes of traffic defined are defined:
 - UBR Without PCR
 - UBR With PCR
 - CBR
 - Non-Realtime VBR
 - Realtime VBR

Connection Type Screen

Select the type of network protocol and encapsulation mode over the ATM PVC that your ISP has instructed you to use, then click on Next button.

Figure 5-3. Connection Type Screen

Select a connection type and click on Next.

Bridge Service and Quality of Service Screen

This WAN service can be enabled or disabled by clicking in the check box.

Enabling QoS for a PVC improves performance for selected classes of applications. However, since QoS also consumes system resources, the number of PVCs is reduced. The default setting for QoS is disabled. If you want to enable QoS service, select the "Enable Quality Of Service" check box.

After finishing steps as above, click on the Next button.

Firewall – MAC Filtering

MAC filtering can forward or block traffic by MAC address. You can change the policy or add settings to the MAC filtering table using the MAC Filtering Setup screen.

Figure 5-21. IP Filtering - MAC Filtering Setup

If you click on Change Policy, a confirmation dialog lets you verify your change.

Figure 5-22. IP Filtering - MAC Filtering Policy Change Confirmation

Download from Www.Somanuals.com. All Manuals Search And Download.

If you want to add a setting to the MAC filtering table, enter the Source and Destination MAC address, and select protocol type, frame direction, and WAN interface. Then click on Save/Apply to save it.

Figure 5-37. DSL Settings

Modulation Methods

The following modulation methods are supported by the 6211 ADSL router:

- G.dmt Enabled
- G.lite Enabled
- T1.413 Enabled
- ADSL Enabled
- Annex L Enabled
- ADSL2+ Enabled.

Do not change this setting unless so directed by your ISP.

Phone Line Pair

The 6211 ADSL router supports phone lines on pins 2 and 3 or pins 1 and 4 to connect your ADSL line. If your phone system uses pins 2 and 3, attach a normal RJ11 cable to the router and select "Inner pair" on the screen; if your phone system uses pins 1 and 4, attach the phone with the supplied RJ11 cable and select "Outer pair" on the screen.

Capability

The following are included under Capability:

- Bitswap Enable
- SRA (Seamless Rate Adaptation) Enable

Do not change these settings unless so directed by your ISP.

DSL Advanced Settings

Do not change the DSL Advanced Settings unless so directed by your ISP. To view the DSL Advanced Settings screen, click on the Advanced Settings button on the DSL Settings screen (see Figure 5-37).

There are five test modes between the router and your ISP:

- Normal test: Puts the router in a test mode in which it only sends a Normal signal.
- Reverb test: Puts the router in a test mode in which it only sends a Reverb signal.
- Medley test: Puts the router in a test mode in which it only sends a Medley signal.
- No Retrain: In this mode the router will try to establish a connection as in normal mode, but once the connection is up it will not retrain if the signal is lost.
- L3: Puts the router into the L3 power state.

⊕- <mark>©</mark> Management		Apply Tone Selection

Figure 5-38. DSL Advanced Settings

Tone Selection

To view the ADSL Tone Settings screen, click on the Tone Selection button of the DSL Advanced Settings screen (see Figure 5-38).

The frequency band of ADSL is split up into 256 separate tones, each spaced 4.3125 kHz apart. With each tone carrying separate data, the technique operates as if 256 separate modems were running in parallel. The tone range is from 0 to 31 for upstream and from 32 to 255 for downstream.

Do not change these settings unless so directed by your ISP.

Select the desired values and click on Save/Apply to configure the SNMP options.

Internet Time

Use the Internet Time screen to specify whether the router uses Simple Network Time Protocol (SNTP) to obtain the time of day from SNTP servers on the Internet.

To set up the router to obtain time from an SNTP server:

1. Select "Automatically synchronize with Internet time servers". The SNTP fields appear.

Figure 7-14. Internet Time Screen

- 2. Select SNTP servers.
- 3. Specify the time zone offset for your router's location.
- 4. Click on Save/Apply.

Access Control – Services

You can enable or disable some services of your router by LAN or WAN. If no WAN connection is defined, only the LAN side can be configured.

Access Control – IP Addresses

Web access to the router can be limited when Access Control Mode is enabled. The IP addresses of allowed hosts can be added using Access Control -> IP Address.

Figure 7-17. IP Address Setup

First, add the IP address to the IP address list.

Figure 7-18. Access Control – IP Address Add Screen

Then select "Enabled" to enable Access Control Mode.

Figure 7-19. Access Control – IP Address Enable or Disable

Access Control – Passwords

Use Access Control -> Passwords to change a password. Select an account and enter the current password and the new password. Then click on Save/Apply.

Update Software

If your ISP releases new software for this router, follow these steps to perform an upgrade.

1. Obtain an updated software image file from your ISP.

2. Enter the path to the image file location or click on the "Browse" button to locate the image file.

3. Click on the Update Software button once to upload the new image file.

Note

The update process takes about two minutes to complete, and your router will reboot automatically.

Reboot Router

Select Management -> Reboot Router to reboot the router using the web interface. The router will save the current configuration and reboot itself using the new configuration. The rebooting process takes about two minutes to complete.
