TDA8559T

Low-voltage stereo headphone amplifier

Rev. 03 — 15 May 2006 Product data sheets

1. General description

The TDA8559T is a stereo amplifier that operates over a wide supply voltage range from 1.9 V to 30 V and consumes a very low quiescent current. This makes it suitable for battery fed applications (2 × 1.5 V cells). Because of an internal voltage buffer, this device can be used with or without a capacitor connected in series with the load. It can be applied as a headphone amplifier, but also as a mono amplifier with a small speaker (25 Ω), or as a line driver in mains applications.

2. Features

- Operating voltage from 1.9 V to 30 V
- Very low quiescent current
- Low distortion
- Few external components
- Differential inputs
- Usable as a mono amplifier in Bridge-Tied Load (BTL) or stereo Single-Ended (SE)
- Single-ended mode without loudspeaker capacitor
- Mute and Standby mode
- Short-circuit proof to ground, to supply voltage (< 10 V) and across load
- No switch on or switch off clicks
- ESD protected on all pins

3. Applications

- Portable telephones
- MP3 players
- Portable audio
- Mains fed equipment

8. Functional description

The TDA8559T contains two amplifiers with differential inputs, a $0.5V_P$ output buffer and a high supply voltage stabilizer. Each amplifier consists of a voltage-to-current converter (V/I), an output amplifier and a common dynamic quiescent current controller. The gain of each amplifier is internally fixed at 26 dB (= 20 ×). The $0.5V_P$ output can be used as a replacement for the single-ended capacitors. The two amplifiers can also be used as a mono amplifier in a BTL configuration thereby resulting in more output power.

With three mode select pins, the device can be switched into the following modes:

1. Standby mode ($I_P < 10\ \mu A$)
2. Mute mode
3. Operation mode, with two input selections (the input source is directly connected or connected via coupling capacitors at the input).

The ripple rejection in the stereo application with a single-ended capacitor can be improved by connecting a capacitor between the $0.5V_P$ capacitor pin and ground.

The device is fully protected against short-circuiting of the output pins to ground, to the low supply voltage pin and across the load.

8.1 V/I converters

The V/I converters have a transconductance of 400 μS. The inputs are completely symmetrical and the two amplifiers can be used in opposite phase. The Mute mode causes the V/I converters to block the input signal. The input mode pin selects two applications in which the V/I converters can be used.

The first application (input mode pin floating) is used with a supply voltage below 6 V. The input DC level is at ground level (the unused input pin connected to ground) and no input coupling capacitors are necessary. The maximum converter output current is sufficient to obtain an output swing of 3 V (peak).

In the second application with a supply voltage greater than 6 V (input mode pin HIGH), the input mode pin is connected to V_P. In this configuration (input DC level is $0.5V_P + 0.6$ V) the input source must be coupled with a capacitor and the two unused input pins must be connected via a capacitor to ground, to improve noise performance. This application has a higher quiescent current, because the maximum output current of the V/I converter is higher to obtain an output voltage swing of 9 V (peak).

8.2 Output amplifiers

The output amplifiers have a transresistance of 50 kΩ, a bandwidth of approximately 750 kHz and a maximum output current of 100 mA. The mid-tap output voltage equals the voltage applied at the non-inverting pin of the output amplifier. This pin is connected to the output of the $0.5V_P$ buffer. This reduces the distortion when the load is connected between an output amplifier and the buffer (because feedback is applied over the load).

8.3 Buffer

The buffer delivers $0.5V_P$ to the output with a maximum output (sink and source) current of 200 mA (peak).

8.4 Dynamic quiescent controller

The Dynamic Quiescent Current controller (DQC) gives the advantage of low quiescent current and low distortion. When there are high frequencies in the output signal, the DQC will increase the quiescent current of the two output amplifiers and the buffer. This will reduce the crossover distortion that normally occurs at high frequencies and low quiescent current. The DQC gives output currents that are linear with the amplitude and the frequency of the output signals. These currents control the quiescent current.

8.5 Stabilizer

The TDA8559T has a voltage supply range from 1.9 V to 30 V. This range is divided over two supply voltage pins. Pin 16 is 1.9 V to 18 V (breakdown voltage of the process); this pin is preferred for supply voltages less than 18 V. Pin 15 is used for applications where V_P is approximately 6 V to 30 V. The stabilizer output is internally connected to the supply voltage pin 16. In the range from 6 V to 18 V, the voltage drop to pin 16 is 1 V. In the range from 18 V to 30 V the stabilizer output voltage (to pin 16) is approximately 17 V.

8.6 Input logic

The MUTE pin (pin 7) selects the Mute mode of the V/I converters. LOW (TTL/CMOS) level is mute. A voltage between 0.5 V (low level) and 1.5 V (high level) causes a soft mute to operate (no plops). When pin 7 is floating or greater than 1.5 V it is in the operating condition.

The input mode pin must be connected to V_P when the supply voltage is greater than 6 V. The input mode logic raises the tail current of the V/I converters and enables the two buffers to bias the inputs of the V/I converters.

8.7 Reference

This circuit supplies all currents needed in this device. With the Standby mode pin 1 (TTL/CMOS), it is possible to switch to the Standby mode and reduce the total quiescent current to below 10 μA.

[1] The supply voltage range at pin V_{P1} is from 1.9 V to 18 V. Pin V_{P2} is used for the voltage range from 6 V to 30 V.

[2] Measured with low-pass filter 30 kHz.

[3] Noise output voltage measured with a bandwidth of 20 Hz to 20 kHz, unweighted. R_s = 5 kΩ.

[4] RMS output voltage in mute is measured with V_i = 200 mV (RMS); f = 1 kHz.

[5] DC output offset voltage is measured between the signal output and the $0.5V_P$ output.

[6] The ripple rejection is measured with a ripple voltage of 200 mV (RMS) applied to the positive supply rail (R_s = 0 kΩ).

[7] DC output offset voltage is measured between the two signal outputs.

13. Application information

13.1 General

For applications with a maximum supply voltage of 6 V (input mode low) the input pins need a DC path to ground (see Figure 3 and Figure 4). For applications with supply voltages in the range from 6 V to 18 V (input mode HIGH) the input DC level is $0.5V_P$ + 0.6 V. In this situation the input configurations illustrated in Figure 5 and Figure 6 have to be used.

The capacitor Cb is recommended for stability improvement. The value may vary between 10 nF and 100 nF. This capacitor should be placed close to the IC between pin 12 and pin 13.

13.2 Heatsink design

The standard application is stereo headphone single-ended with a 32 Ω load impedance to buffer (see Figure 9). The headphone amplifier can deliver a peak output current of 150 mA into the load.

For the SO16 envelope $R_{th(j-a)}$ = 105 K/W; the maximum sinewave power dissipation for T_{amb} = 25 °C is: $1.2\ \mathrm{W} = \frac{150 - 25}{105}$

For T_{amb} = 60 °C the maximum total power dissipation is: $0.85\ \mathrm{W} = \frac{150 - 60}{105}$

13.3 Test conditions

T_{amb} = 25 °C; unless otherwise specified: V_P = 3 V, f = 1 kHz, R_L = 32 Ω, Gain = 26 dB, low input mode, band-pass filter: 22 Hz to 30 kHz. The total harmonic distortion as a function of frequency was measured with low-pass filter of 80 kHz. The quiescent current has been measured without any load impedance.

In applications with coupling capacitors towards the load, an electrolytic capacitor has to be connected to pin 4 (SVRR).

1. The graphs for the single-ended application have been measured with the application illustrated in Figure 9; input configuration for input mode low (Figure 4) and input configuration for input mode high (Figure 6).
2. The graphs for the BTL application ‘input mode low’ have been measured with the application circuit illustrated in Figure 11 and the input configuration illustrated in Figure 4.
3. The graphs for the line-driver application have been measured with the application circuit illustrated in Figure 13 and the input configuration illustrated in Figure 6; input mode high.

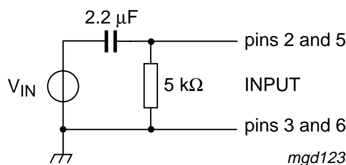
Download from Www.Somanuals.com. All Manuals Search And Download.

13.4 Input configurations

The IC can be applied in two ways, 'input mode low' and 'input mode high'. This can be selected by the input mode at pin 8:

1. Input mode low: pin 8 floating: The DC level of the input pins has to be between 0 V and (V_P – 1.8 V). A DC path to ground is needed. The maximum output voltage is approximately 2.1 V (RMS). Input configurations illustrated in Figure 3 and Figure 4 should be used.
2. Input mode high: pin 8 is connected to V_P: This mode is intended for supply voltages > 6 V. It can deliver a maximum output voltage of approximately 6 V (RMS) at THD = 0.5 %. The DC voltage level of the input pins is ($0.5V_P$ + 0.6 V). Coupling capacitors are necessary. Input configurations illustrated in Figure 5 and Figure 6 should be used.



V_P < 6 V.

13.5 Standby/mute

1. The Standby mode ($V_1 < 0.5$ V) is intended for power saving purpose. Then the total quiescent current is < 10 μA.
2. To avoid 'pop-noise' during switch-on or switch-off the IC can be muted ($V_7 < 0.5$ V). This can be achieved by a 'soft-mute' circuit or by direct control from a microcontroller.

13.6 Application 1: SE with loudspeaker capacitor

The value of capacitor Cr influences the behavior of the Supply Voltage Ripple Rejection (SVRR) at low frequencies; increasing the value of Cr increases the performance of the SVRR; see Figure 8.

13.7 Application 2: SE to buffer (without loudspeaker capacitor)

This is the basic headphone application. The advantage of this application with respect to application 1, is that it needs only one external component (Cb) in the event of stability problems; see Figure 9.

13.8 Application 3: Improved SE to buffer (without loudspeaker capacitor)

This application is an improved configuration of application 2. The distinction between the two is connecting the loads in opposite phase. This lowers the average current through the SE buffer. It should be noted that a headphone cannot be used because the load requires floating terminals; see Figure 10.

13.9 Application 4: Bridge tied load mono amplifier

This configuration delivers four times the output power of the SE application with the same supply and load conditions. The capacitor Cr is not required; see Figure 11.

13.10 Application 5: Line driver application

The TDA8559T delivers a virtual rail-to-rail output voltage and is also usable in a low voltage environment, as a line driver. In this application the input needs a DC path to ground, input configurations illustrated in Figure 3 and Figure 4 should be used. The value of capacitor Cr influences the behavior of the SVRR at low frequencies; increasing the value of Cr increases the performance of the SVRR; see Figure 12.

13.11 Application 6: Line driver application

The TDA8559T delivers a virtual rail-to-rail output voltage. Because the input mode has to be high, the input configurations illustrated in Figure 5 and Figure 6 should be used. This application can also be used for headphone application, however, due to the limited output current and the limited output power at the headphone, series resistors have to be used between the output pins and the load; see Figure 13.

The value of capacitor Cr influences the behavior of the SVRR at low frequencies; increasing the value of Cr increases the performance of the SVRR.

Download from Www.Somanuals.com. All Manuals Search And Download.

13.12 Application 7: Line driver application

With the supply voltage connected to pin 15 it is possible to use the head amplifier above the maximum of 18 V to pin 16. The internal supply voltage will be reduced to a maximum of approximately 17 V.

This will be convenient in applications where the supply voltage is higher than 18 V, however an output voltage swing that reaches the higher supply voltage is not required. the input configurations illustrated in Figure 5 and Figure 6 should be used. This application can also be used for headphone applications. However, due to the limited output current, series resistors have to be used between the output pins and the load; see Figure 14.

16. Soldering

16.1 Introduction to soldering surface mount packages

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

16.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 seconds and 200 seconds depending on heating method.

Typical reflow temperatures range from 215 °C to 260 °C depending on solder paste material. The peak top-surface temperature of the packages should be kept below:

Table 8. SnPb eutectic process - package peak reflow temperatures (from *J-STD-020C* July 2004)

Package thickness	Volume mm^3 < 350	Volume mm^3 ≥ 350
< 2.5 mm	240 °C + 0/–5 °C	225 °C + 0/–5 °C
≥ 2.5 mm	225 °C + 0/–5 °C	225 °C + 0/–5 °C

Table 9. Pb-free process - package peak reflow temperatures (from *J-STD-020C* July 2004)

Package thickness	Volume mm^3 < 350	Volume mm^3 350 to 2000	Volume mm^3 > 2000
< 1.6 mm	260 °C + 0 °C	260 °C + 0 °C	260 °C + 0 °C
1.6 mm to 2.5 mm	260 °C + 0 °C	250 °C + 0 °C	245 °C + 0 °C
≥ 2.5 mm	250 °C + 0 °C	245 °C + 0 °C	245 °C + 0 °C

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

16.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):

© Koninklijke Philips Electronics N.V. 2006. All rights reserved.

Download from Www.Somanuals.com. All Manuals Search And Download.

  - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
  - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

  The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 seconds to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

16.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 seconds to 5 seconds between 270 °C and 320 °C.

16.5 Package related soldering information

Table 10. Suitability of surface mount IC packages for wave and reflow soldering methods

Package[1]	Soldering method	
	Wave	Reflow[2]
BGA, HTSSON..T[3], LBGA, LFBGA, SQFP, SSOP..T[3], TFBGA, VFBGA, XSON	not suitable	suitable
DHVQFN, HBCC, HBGA, HLQFP, HSO, HSOP, HSQFP, HSSON, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable[4]	suitable
PLCC[5], SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended[5][6]	suitable
SSOP, TSSOP, VSO, VSSOP	not recommended[7]	suitable
CWQCCN..L[8], PMFP[9], WQCCN..L[8]	not suitable	not suitable

[1] For more detailed information on the BGA packages refer to the *(LF)BGA Application Note* (AN01026); order a copy from your Philips Semiconductors sales office.

[2] All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the *Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods*.

© Koninklijke Philips Electronics N.V. 2006. All rights reserved.

Download from Www.Somanuals.com. All Manuals Search And Download.

[3] These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding 217 °C ± 10 °C measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.

[4] These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.

[5] If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.

[6] Wave soldering is suitable for LQFP, QFP and TQFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.

[7] Wave soldering is suitable for SSOP, TSSOP, VSO and VSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.

[8] Image sensor packages in principle should not be soldered. They are mounted in sockets or delivered pre-mounted on flex foil. However, the image sensor package can be mounted by the client on a flex foil by using a hot bar soldering process. The appropriate soldering profile can be provided on request.

[9] Hot bar soldering or manual soldering is suitable for PMFP packages.

18. Legal information

18.1 Data sheet status

Document status[1][2]	Product status[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.semiconductors.philips.com.

18.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. Philips Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local Philips Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

18.3 Disclaimers

General — Information in this document is believed to be accurate and reliable. However, Philips Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

Right to make changes — Philips Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — Philips Semiconductors products are not designed, authorized or warranted to be suitable for use in medical, military, aircraft, space or life support equipment, nor in applications where failure or malfunction of a Philips Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. Philips Semiconductors accepts no liability for inclusion and/or use of Philips Semiconductors products in such equipment or applications and therefore such inclusion and/or use is for the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) may cause permanent damage to the device. Limiting values are stress ratings only and operation of the device at these or any other conditions above those given in the Characteristics sections of this document is not implied. Exposure to limiting values for extended periods may affect device reliability.

Terms and conditions of sale — Philips Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.semiconductors.philips.com/profile/terms, including those pertaining to warranty, intellectual property rights infringement and limitation of liability, unless explicitly otherwise agreed to in writing by Philips Semiconductors. In case of any inconsistency or conflict between information in this document and such terms and conditions, the latter will prevail.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.
