This manual is for the PCI-6871.

Part No. 2006687110 1st Edition, Dec, 2002

Packing List

Before you begin installing your card, please make sure that the following materials have been shipped:

- 1 ea. PCI-6871 all-in-one single board computer
- 1 ea. startup manual
- CD-ROM or disks for utility, drivers, and manual (in PDF format)
- 1 ea. power cable p/n: 1703080101
- 1 ea. PS/2 KB/M cable p/n: 1700060202
- 1 ea. Printer cable p/n:1700260250
- 1 ea. FDD cable p/n:1701340603
- 1 ea. EIDE cable p/n:1701400452

If any of these items are missing or damaged, contact your distributor or sales representative immediately.

Model No. List Description

PPCI-6871F-J0A1 PCI Eden400 Half-sized SBC with SODIMM/VGA LCD/LVDS/LAN and CFC2

Additional Information and Assistance

1. Visit the manufacturer's web site at **www.emacinc.com** where you can find the latest information about the product.

2. Contact your distributor, sales representative, or customer service center for technical support if you need additional assistance. Please have the following information ready before you call:

- · Product name and serial number
- Description of your peripheral attachments
- Description of your software (operating system, version, application software, etc.)
- A complete description of the problem
- The exact wording of any error messages

CHAPTER

General Information

This chapter gives background information on the PCI-6871.

Sections include:

- Introduction
- Features
- Specifications
- Board layout and dimensions

Chapter 1 Introduction

1.1 Introduction

The new PCI-6871 is a half-sized CPU card with onboard VIA Eden400 C3 EBGA fanless CPU. The VIA Eden processor uses advanced 0.13µ CMOS technology with 128KB L1 cache memory and 64KB L2 cache memory on die. This board with Eden400 CPU can operate without a fan at temperatures up to 60° C (140° F) and typically consumes under 14 Watts while supporting numerous peripherals. This SBC includes a 4X AGP controller, a PCI Ethernet interface, and 36-bit TTL interface. Its design is based on the half-sized CPU card and supports PCI bus expansion. Other on-board features include an FDD, LPT, 4 USBs, and 2 serial ports. PCI-6871 supports AC97 audio with the addition of the optional PCM-231A-00A1 audio module. This product uses a VIA VT8606 "TwisterT" chip with Integrated Savage4 2D/3D/Video Accelerator and supports 4X AGP VGA/LCD interface and up to 32 MB frame buffer using system memory. The PCI-6871 supports one 10/100Mbps Ethernet connection with an onboard RJ-45 connector, and is effective for use as a firewall, VPN, or other communication device.

1.2 Features

- Embedded low power VIA Eden C3 EGBA 400MHz processor
- · Half-sized CPU card with PCI golden finger
- Fanless operation at 60° C.
- 1 onboard RJ-45 connector supports 10/100Base-T Ethernet
- 4X AGP graphics for high performance applications
- Supports PC/104
- · Supports wake on LAN
- Supports wake on Modem
- Supports LCD backlight turn-off function

1.3 Specifications

1.3.1 Standard SBC Functions

- CPU: VIA C3 fanless EBGA 400MHz processor
- System chipset: VIA VT8606 "TwisterT" +VT82C686B
- BIOS: Award 256 KB Flash memory
- System memory: Two 144-pin SODIMM sockets (on the backside) accept 32 MB up to 512MBx2 (total 1024MB) SDRAM
- **2nd cache memory:** 64KB on the C3 fanless EBGA 400MHz processor
- FDD interface: Supports up to two FDDs
- Serial ports: Two serial ports:

COM1: RS-232 COM2: RS-232/422/485

• Parallel port: Parallel port supports SPP/EPP/ECP mode

- **Keyboard/mouse connector:** Supports standard PC/AT keyboard and a PS/2 mouse
- **Power management:** Supports power saving modes including Normal/Standby/Suspend modes. APM 1.2 compliant
- Watchdog timer: 62 level timer intervals
- USB: Four universal serial bus ports
- PC/104 expansion: PC/104 connector for ISA control board
- Solid State Disk: Supports one 50-pin socket for CFC type I/II

1.3.2 VGA/LCD/LVDS Interface

- Chipset: VIA TwisterT chip with integrated Savage4 2D/3D/Video Accelerator
- Frame buffer: Supports 8/16/32 MB frame buffer with system memory
- Interface: 4X AGP VGA/LCD interface, Support for 9, 12, 15, 18, 24, 36 bit TFT and optional 16- or 24-bit DSTN panel
- Display mode: CRT Modes: 1280 x 1024@32bpp (60Hz), 1024 x 768 @ 32bpp (85 Hz); LCD/Simultaneous Modes: 1280 x 1024@16bpp (60 Hz), 1024 x 768@16bpp (60Hz)
- **1.3.3 LVDS:** Supports 2 Channel (2 x 18 bit) LVDS interface • Chipset: VIA VT8606T (TwisterT)

1.3.4 PCI bus Ethernet interface

- Chipset: REALTEK RTL8139 Ethernet controller
- Ethernet interface: IEEE 802.3U compatible 100/10Base-T interface. Includes software drivers and boot ROM
- Wake-on-LAN: Supports wake-on-LAN function with ATX power control

1.3.5 Mechanical and Environmental

- Dimensions (L x W): 185 x 122 mm (7.28" x 4.80")
- Power supply voltage: +5 V ±5%, +12V ±5%
- Power requirements:
 - Max: 10.33A @ +5V,205mA@+12V
 - (with 128 MB SDRAM, VIA C3-400MHz CPU)
 - Typical: 2.37A @ +5V,34.02mA@+12V

(with 256 MB SDRAM, VIA C3-400MHz CPU)

- **Operating temperature:** $0 \sim 60^{\circ}$ C $(32 \sim 140^{\circ}$ F)
- Weight: 0.27 kg (weight of total package)

Figure 1.1: Board layout: dimensions (component side)

Figure 1.2: Board layout: dimensions (solder side)

Installation

This chapter explains the setup procedures of PCI-6871 hardware, including instructions on setting jumpers and connecting peripherals, switches and indicators. Be sure to read all safety precautions before you begin the installation procedure.

Chapter 2 Installation

2.1 Jumpers

The PCI-6871 has a number of jumpers that allow you to configure your system to suit your application. The table below lists the functions of the various jumpers.

Table 2.1: Jumpers			
Label	Function		
JP1	CMOS clear		
JP2	LAN power select		
JP3	RS-232/422/485 select		
JP4	Watch-Dog output selct		
S1	Panel type select		

2.2 Connectors

On-board connectors link the PCI-6871 to external devices such as hard disk drives, a keyboard, or floppy drives. The table below lists the function of each of the board's connectors.

Table 2.2: Connectors			
Label	Function		
CN1	Primary IDE		
CN2	LPT		
CN3	ATX Power feature connector		
CN4	USB1,2		
CN5	PWR_SW		
CN6	Floppy		
CN7	Secondary IDE		
CN8	Reset		

Table 2.2	Table 2.2: Connectors

FAN1	CPU fan power			

Figure 2.1: Jumper locations

Figure 2.2: Connectors (component side)

2.5 Setting Jumpers

You may configure your card to match the needs of your application by setting jumpers. A jumper is a metal bridge used to close an electric circuit. It consists of two metal pins and a small metal clip (often protected by a plastic cover) that slides over the pins to connect them. To "close" a jumper, you connect the pins with the clip. To "open" a jumper, you remove the clip. Sometimes a jumper will have three pins, labeled 1, 2 and 3. In this case you would connect either pins 1 and 2, or 2 and 3.

The jumper settings are schematically depicted in this manual as follows:.

A pair of needle-nose pliers may be helpful when working with jumpers.

If you have any doubts about the best hardware configuration for your application, contact your local distributor or sales representative before you make any changes.

Generally, you simply need a standard cable to make most connections.

Warning! To avoid damaging the computer, always turn off the power supply before setting "Clear CMOS." Before turning on the power supply, set the jumper back to "3.0 V Battery On."

This jumper is used to erase CMOS data and reset system BIOS information.

The procedure for clearing CMOS is:

- 1. Turn off the system.
- 2. Short pin 2 and pin 3.
- 3. Return jumper to pins 1 and 2.
- 4. Turn on the system. The BIOS is now reset to its default setting

Table 2.3: CMOS clear (JP1)

* default setting

2.7 Installing system memory (SODIMMs)

You can install anywhere from 32 to 512 MB of SDRAM into your PCI-6871 Series card. The card provides two 144-pin SODIMM sockets. Each socket accepts 32/64/128/256/512 MB 3.3 V power level SODIMMs. If only one SODIMM module is installed, it may be installed in either SODIMM socket on the solder side of the PCI-6871 Series card.

Note: PCI-6871 Series cards only support SDRAM SODIMM modules. EDO SODIMM is not supported.

2.7.1 Installing SODIMMs

Note: The modules can only fit into a socket one way. The gold pins must point down into the SODIMM socket.

The procedure for installing SODIMMs appears below. Please follow these steps carefully.

- 1. Make sure that all power supplies to the system are switched off.
- 2. Install the SODIMM card. Install the SODIMM so that its gold pins point down into the SODIMM socket.
- 3. Slip the SODIMM into the socket at a 45 degree angle and carefully fit the bottom of the card against the connectors.
- 4. Gently push the SODIMM into a perpendicular position until the clips on the ends of the SODIMM sockets snap into place.
- 5. Check to ensure that the SODIMM is correctly seated and all connector contacts touch. The SODIMM should not move around in its socket.

Important: Only use standard form SODIMM memory modules (as shown in the diagram below). Standardized dimensions ensure a proper fit. Check with your memory supplier about the SODIMM modules you will use.

Figure 2.3: SODIMM module

2.8 IDE, CDROM hard drive connector (CN1, CN7)

The PCI-6871 provides 2 IDE channels which you can attach up to four Enhanced Integrated Device Electronics hard disk drives or CDROM to the PCI-6871's internal controller. The PCI-6871's IDE controller uses a PCI interface. This advanced IDE controller supports faster data transfer, PID mode 3, mode 4 and UDMA/100. The secondary channel supports UDMA/33 only.

2.8.1 Connecting the hard drive

Connecting drives is done in a daisy-chain fashion. It requires one of two cables (not included in this package), depending on the drive size. 1.8" and 2.5" drives need a 1 x 44-pin to 2 x 44-pin flat-cable connector. 3.5" drives use a 1 x 44-pin to 2 x 40-pin connector.

Wire number 1 on the cable is red or blue, and the other wires are gray.

- 1. Connect one end of the cable to CN1 or CN7. Make sure that the red (or blue) wire corresponds to pin 1 on the connector, which is labeled on the board (on the right side).
- Plug the other end of the cable into the Enhanced IDE hard drive, with pin 1 on the cable corresponding to pin 1 on the hard drive. (See your hard drive's documentation for the location of the connector.)

If desired, connect a second drive as described above.

Unlike floppy drives, IDE hard drives can connect to either end of the cable. If you install two drives, you will need to set one as the master and one as the slave by using jumpers on the drives. If you install only one drive, set it as the master.

2.9 Solid State Disk

The PCI-6871 provides a 50-pin socket for CompactFlash card type I/II.

2.9.1 CompactFlash (CN28)

The CompactFlash card shares a secondary IDE channel which can be enabled/disabled via the BIOS settings.

2.10 Floppy drive connector (CN6)

You can attach up to two floppy drives to the PCI-6871's on-board controller. You can use any combination of 5.25" (360 KB and 1.2 MB) and/ or 3.5" (720 KB, 1.44 MB, and 2.88 MB) drives.

A 34-pin daisy-chain drive connector cable is required for a dual-drive system. On one end of the cable is a 34-pin flat-cable connector. On the other end are two sets of floppy disk drive connectors. Each set consists of a 34-pin flat-cable connector (usually used for 3.5" drives) and a printed-circuit board connector (usually used for 5.25" drives).

2.10.1 Connecting the floppy drive

- 1. Plug the 34-pin flat-cable connector into CN6. Make sure that the red wire corresponds to pin one on the connector.
- 2. Attach the appropriate connector on the other end of the cable to the floppy drive(s). You can use only one connector in the set. The set on the end (after the twist in the cable) connects to the A: drive. The set in the middle connects to the B: drive.
- 3. If you are connecting a 5.25" floppy drive, line up the slot in the printed circuit board with the blocked-off part of the cable connector.

If you are connecting a 3.5" floppy drive, you may have trouble determining which pin is number one. Look for a number printed on the circuit board indicating pin number one. In addition, the connector on the floppy drive may have a slot. When the slot is up, pin number one should be on the right. Check the documentation that came with the drive for more information.

If you desire, connect the B: drive to the connectors in the middle of the cable as described above.

In case you need to make your own cable, you can find the pin assignments for the board's connector in Appendix C.

2.11 Parallel port connector (CN2)

Normally, the parallel port is used to connect the card to a printer. The PCI-6871 includes a multi-mode (ECP/EPP/SPP) parallel port accessed via CN2 and a 26-pin flat-cable connector. You will need an adapter cable if you use a traditional DB-25 connector. The adapter cable has a 26-pin connector on one end, and a DB-25 connector on the other.

The parallel port is designated as LPT1, and can be disabled or changed to LPT2 or LPT3 in the system BIOS setup.

The parallel port interrupt channel is designated to be IRQ7.

You can select ECP/EPP DMA channel via BIOS setup.

2.12 Keyboard and PS/2 mouse connector (CN25)

The PCI-6871 board provides a keyboard connector that supports both a keyboard and a PS/2 style mouse. In most cases, especially in embedded applications, a keyboard is not used. If the keyboard is not present, the

standard PC/AT BIOS will report an error or fail during power-on selftest (POST) after a reset. The PCI-6871's BIOS standard setup menu allows you to select "All, But Keyboard" under the "Halt On" selection. This allows no-keyboard operation in embedded system applications, without the system halting under POST.

2.13 Power & HDD LED, Reset Button Connector (CN13, CN8)

Next, you may want to install external switches to monitor and control the PCI-6871. These features are optional: install them only if you need them. The front panel connector (CN13) is an 8-pin male, dual in-line header. It provides connections for a speaker, hard disk access indicator, watchdog output, and an input switch for resetting the card.

2.13.1 Power & HDD LED (CN13)

The HDD LED indicator for hard disk access is an active low signal (24 mA sink rate). Power supply activity LED indicator.

2.13.2 Reset switch (CN8)

If you install a reset switch, it should be an open single pole switch. Momentarily pressing the switch will activate a reset. The switch should be rated for 10 mA, 5 V.

2.14 Power connectors (CN11, FAN1)

2.14.1 Main power connector, +5 V, +12 V (CN11)

Supplies main power to the PCI-6871 (+5 V), and to devices that require +12 V.

2.14.2 CPU Fan power supply connector (FAN1)

Provides power supply to CPU cooling fan. Only present when +5 V and +12 V power is supplied to the board.

2.15.1 ATX feature connector (CN3) and soft power switch connector (CN5)

The PCI-6871 can support an advanced soft power switch function, if an ATX power supply is used. To enable the soft power switch function:

- 1. Get the specially designed ATX-to-EBX power cable (PCI-6871 optional item, part no. 1703200100)
- 2. Connect the 3-pin plug of the cable to CN3 (ATX feature connector).
- 3. Connect the power on/off button to CN5. (A momentary type of button should be used.)
- *Important* Make sure that the ATX power supply can take at least a 10 mA load on the 5 V standby lead (5VSB). If not, you may have difficulty powering on your system.

Figure 2.4: Wiring for ATX soft power switch function

2.16 IR connector (CN9)

This connector supports the optional wireless infrared transmitting and receiving module. This module mounts on the system case. You must configure the setting through BIOS setup.

2.17 Audio interfaces (CN10)

The Audio link is a 10 pin connector; the PCI-6871 can support AC97 Audio with the addition of optional PCM-231A-00A1.

2.18 COM port connector (CN19, CN20)

The PCI-6871 provides two serial ports (COM1:RS-232; COM2: RS-232/422/485) in one COM port connector. The COM port connector is a 40-pin, dual-inline, male header. It provides connections for serial devices (a mouse, etc.) or a communication network. You can find the pin assignments for the COM port connector in Appendix C.

2.18.1 COM2 RS-232/422/485 setting (JP3)

COM2 can be configured to operate in RS-232, RS-422, or RS-485 mode. This is done via JP3

JP3: COM2 RS-232/422/485 select					
PINS	RS-232*	RS-422	RS-485		
1-2	Closed	Open	Open		
3-4	Open	Closed	Open		
5-6	Open	Open	Closed		

2.19 VGA/LCD/LVDS interface connections

The PCI-6871's PCI SVGA interface can drive conventional CRT displays and is capable of driving a wide range of flat panel displays, including passive LCD and active LCD displays. The board has three connectors to support these displays: one for standard CRT VGA monitors, one for flat panel displays, and one for LVDS type LCD panels.

2.19.1 CRT display connector (CN12)

CN12 is a standard 15-pin D-SUB connector commonly used for VGA. The pin assignments for CRT display connector CN12 are detailed in Appendix C.

2.19.2 Flat panel display connector (CN18)

CN18 consists of a 40-pin connector which can support a 24-bit LCD panel. It is Hirose's product no. DF13A-40DP-1.25 V

The PCI-6871 provides a bias control signal on CN18 that can be used to control the LCD bias voltage. It is recommended that the LCD bias voltage not be applied to the panel until the logic supply voltage (+5 V or +3.3 V) and panel video signals are stable. Under normal operation, the control signal (ENAVEE) is active high. When the PCI-6871's power is applied, the control signal is low until just after the relevant flat panel signals are present. CN18 can connect up to 24 bit TFT LCD.

2.19.3 Extension flat panel connector (CN17)

CN17 consists of a 20-pin connector which is Hirose's product no. DF13A-20DP-1.25V. The PCI-6871 supports a 36-bit LCD panel which must be connected to both the CN18 (40-pin) and the CN17 (20-pin). The pin assignments for both CN18and the CN17 can be found in Appendix C

2.19.4 LVDS LCD panel connector (CN21)

The PCI-6871 uses the VIA TwisterT chip that supports 2 channel (2 x 18 bit) LVDS LCD panel displays. Users can connect to either an 18-bit or 36-bit LVDS LCD with CN21.

2.19.5 Panel type selection (S1)

S1 is an 8 segment DIP switch for DSTN/TFT panel type and resolution functions.

Table	Table 2.4: S1 Panel Type select

OFF	OFF	OFF	OFF	DSTN	1024x768**	24bit

* Default setting

** will support in the future

2.20 Ethernet configuration

The PCI-6871 is equipped with a high performance 32-bit PCI-bus Ethernet interface which is fully compliant with IEEE 802.3U 10/100Mbps CSMA/CD standards. It is supported by all major network operating systems.

The medium type can be configured via the RSET8139.EXE program included on the utility disk. (See Chapter 3 for detailed information.)

2.20.1 100Base-T connector (CN15)

CN15 is an RJ-45 connector with LED..

2.20.2 Network boot

The Network Boot feature can be utilized by incorporating the Boot ROM image files for the appropriate network operating system. The Boot ROM BIOS files are included in the system BIOS, which is on the utility CD disc.

2.20.3 LAN controller power select (JP2)

* default setting

Note: PCI-6871 supports Wake-on-LAN. For Wake-on LAN, J6 has to be set to the Standby 3.3 V position

2.21 Watchdog timer configuration

An on-board watchdog timer reduces the chance of disruptions which EMP (electro-magnetic pulse) interference can cause. This is an invaluable protective device for standalone or unmanned applications. Setup involves one jumper and running the control software (refer to Appendix A).

2.21.1 Watchdog timer action (JP4)

When the watchdog timer activates (CPU processing has come to a halt), it can reset the system or generate an interrupt on IRQ11. This can be set via setting JP4 as shown below:

* default setting

2.22 USB connectors (CN4, CN23)

The PCI-6871 board provides up to four USB (Universal Serial Bus) ports, with USB3 and USB4 optional. This gives complete Plug and Play, and hot attach/detach for up to 127 external devices. The USB interfaces comply with USB specification Rev. 1.1, and are fuse protected.

The USB interface is accessed through two 5 x 2-pin flat-cable connectors, CN4 (USB1, 2); and CN23 (USB3, 4). You will need an adapter cable if you use a standard USB connector. The adapter cable has a 5 x 2-pin connector on one end and a USB connector on the other.

The USB interfaces can be disabled in the system BIOS setup.

CHAPTER 3

Software Configuration

This chapter details the software configuration information. It shows you how to configure the card to match your application requirements. The AWARD System BIOS is covered in Chapter 4.

Sections include:

- Introduction
- Connections for standard LCDs
- Ethernet interface configuration.

Chapter 3 Software Configuration

3.1 Introduction

The PCI-6871 system BIOS and custom drivers are located in a 256 Kbyte, Flash ROM device, designated U18. A single Flash chip holds the system BIOS, VGA BIOS and network Boot ROM image. The display can be configured via CMOS settings. This method minimizes the number of chips and difficulty of configuration. To set different types of LCD panels, please choose "panel type" from the "integrated peripherals" menu in CMOS setup.

3.2 Connections to Three Standard LCDs

The following tables illustrate typical LCD connection pinouts for the PCI-6871.

3.2.1 Connections to Toshiba LTM10C209A (640 x 480 TFT color LCD)

3.3 Ethernet software configuration

The PCI-6871's on-board Ethernet interface supports all major network operating systems. To configure the medium type, to view the current configuration, or to run diagnostics, do the following:

- 1. Power the PCI-6871 on. Make sure that the RSET8139.EXE file is located in the working drive.
- 2. At the prompt, type RSET8139.EXE and press <Enter>. The Ethernet configuration program will then be displayed.
- 3. This simple screen shows all the available options for the Ethernet interface. Just highlight the option you wish to change by using the Up and Down keys. To change a selected item, press <Enter>, and a screen will appear with the available options. Highlight your option and press <Enter>. Each highlighted option has a helpful message guide displayed at the bottom of the screen for additional information.
- 4. After you have made your selections and are sure this is the configuration you want, press ESC. A prompt will appear asking if you want to save the configuration. Press Y if you want to save.

The Ethernet Setup Menu also offers three very useful diagnostic functions. These are:

- 1. Run EEPROM Test.
- 2. Run Diagnostics on Board.
- 3. Run Diagnostics on Network.

Each option has its own display screen that shows the format and result of any diagnostic tests undertaken.

Note For Ethernet installation, please see Chapter 7

PCI-6871 User's Manual

CHAPTER

Award BIOS Setup

This chapter describes how to set BIOS configuration data.

Chapter 4 Award BIOS Setup

4.1 System test and initialization

These routines test and initialize board hardware. If the routines encounter an error during the tests, you will either hear a few short beeps or see an error message on the screen. There are two kinds of errors: fatal and non-fatal. The system can usually continue the boot up sequence with non-fatal errors. Non-fatal error messages usually appear on the screen along with the following instructions:

press <F1> to RESUME

Write down the message and press the F1 key to continue the bootup sequence.

4.1.1 System configuration verification

These routines check the current system configuration against the values stored in the board's CMOS memory. If they do not match, the program outputs an error message. You will then need to run the BIOS setup program to set the configuration information in memory.

There are three situations in which you will need to change the CMOS settings:

- 1. You are starting your system for the first time
- 2. You have changed the hardware attached to your system
- 3. The CMOS memory has lost power and the configuration information has been erased.

The PCI-6871 Series' CMOS memory has an integral lithium battery backup. The battery backup should last ten years in normal service, but when it finally runs down, you will need to replace the complete unit.

4.2 Award BIOS setup

Award's BIOS ROM has a built-in Setup program that allows users to modify the basic system configuration. This type of information is stored in battery-backed CMOS RAM so that it retains the Setup information when the power is turned off.

4.2.1 Entering setup

Power on the computer and press immediately. This will allow you to enter Setup.

4.2.9 Frequency/Voltage Control

By choosing the Frequency/Voltage Control option from the Initial Setup Screen menu, the screen below is displayed. This sample screen contains the manufacturer's default values for the PCI-6871

Figure 4.9: Frequency/Voltage Control

Caution Incorrect settings in Frequency/Voltage Control may damage the system CPU, video adapter, or other hardware.

4.2.10 Load Optimized Defaults

Load Optimized Defaults loads the default system values directly from ROM. If the stored record created by the Setup program should ever become corrupted (and therefore unusable), these defaults will load automatically when you turn the PCI-6871 Series system on.

Figure 4.10: Load BIOS defaults screen

4.2.11 Set Password

Note To enable this feature, you should first go to the Advanced BIOS Features menu, choose the Security Option, and select either Setup or System, depending on which aspect you want password protected. Setup requires a password only to enter Setup. System requires the password either to enter Setup or to boot the system.

A password may be at most 8 characters long.

To Establish Password

- 1. Choose the Set Password option from the CMOS Setup Utility main menu and press <Enter>.
- 2. When you see "Enter Password," enter the desired password and press <Enter>.

- 3. At the "Confirm Password" prompt, retype the desired password, then press <Enter>.
- 4. Select Save to CMOS and EXIT, type <Y>, then <Enter>.

To Change Password

- 1. Choose the Set Password option from the CMOS Setup Utility main menu and press <Enter>.
- 2. When you see "Enter Password," enter the existing password and press <Enter>.
- 3. You will see "Confirm Password." Type it again, and press <Enter>.
- 4. Select Set Password again, and at the "Enter Password" prompt, enter the new password and press <Enter>.
- 5. At the "Confirm Password" prompt, retype the new password, and press <Enter>.
- 6. Select Save to CMOS and EXIT, type <Y>, then <Enter>.

To Disable Password

- 1. Choose the Set Password option from the CMOS Setup Utility main menu and press <Enter>.
- 2. When you see "Enter Password," enter the existing password and press <Enter>.
- 3. You will see "Confirm Password." Type it again, and press <Enter>.
- 4. Select Set Password again, and at the "Enter Password" prompt, don't enter anything; just press <Enter>.
- 5. At the "Confirm Password" prompt, again don't type in anything; just press <Enter>.
- 6. Select Save to CMOS and EXIT, type <Y>, then <Enter>.

4.2.12 Save & Exit Setup

If you select this option and press <Y> then <Enter>, the values entered in the setup utilities will be recorded in the chipset's CMOS memory. The microprocessor will check this every time you turn your system on and use the settings to configure the system. This record is required for the system to operate.

4.2.13 Exit Without Saving

Selecting this option and pressing <Enter> lets you exit the Setup program without recording any new values or changing old ones.

CHAPTER CHAPTER

PCI SVGA Setup

• Introduction

•

- Installation of SVGA drivers -for Windows 95/98/Me -for Windows NT/2000/XP
- Further information

Chapter 5 PCI SVGA Setup

5.1 Introduction

The PCI-6871 has an onboard AGP flat panel/VGA interface. The specifications and features are described as follows:

5.1.1 Chipset

The PCI-6871 uses a VIA TwisterT chipset from VIA Technology Inc. for its AGP/SVGA controller. It supports many popular LCD, and LVDS LCD displays and conventional analog CRT monitors. The VIA8606T VGA BIOS supports color TFT and DSTN LCD flat panel displays. In addition, it also supports interlaced and non-interlaced analog monitors (color and monochrome VGA) in high-resolution modes while

maintaining complete IBM VGA compatibility. Digital monitors

(i.e. MDA, CGA, and EGA) are NOT supported. Multiple frequency

(multisync) monitors are handled as if they were analog monitors.

5.1.2 Display memory

The TwisterT chip can support 8/16/32MB frame buffer shared with system memory; the VGA controller can drive CRT displays or color panel displays with resolutions up to 1280×1024 at 16 M colors.

5.1.3 Display types

CRT and panel displays can be used simultaneously. The PCI-6871 can be set in one of three configurations: on a CRT, on a flat panel display, or on both simultaneously. The system is initially set to simultaneous display mode. If you want to enable the CRT display only or the flat panel display only, please contact VIA Technology Inc., or our sales representative for detailed information.

5.1.4 Dual/Simultaneous Display

The PCI-6871 uses a VIA Twister VT8606T LCD controller that is capable of providing simultaneous dual view display of the same content on a flat panel and CRT.

To set up dual view (simultaneus mode) under Windows 9x, Windows ME, Windows NT/2000/XP, follow these steps:

Step 1. Open the Control panel, and select "Display", "Settings".

Step 2. Select " CRT+LCD " or " CRT+TV " for dual view

Step 3. Click "OK".

PCI-6871 User's Manual

CHAPTER 6

Audio Setup

The PCI-6871 is equipped with an audio interface that records and plays back CD-quality audio. This chapter provides instructions for installing the software drivers included on the audio driver diskettes.

Chapter 6 Audio Setup

6.1 Introduction

The PCI-6871 supports AC97 audio through the optional audio module PCM-231A-00A1.

6.2 DOS utilities

6.2.1 VIA Sound Blaster Pro compatible set up program Please "Enable" the Sound Blaster setting in the BIOS before playing Sound Blaster compatible DOS games. To enable the settings in the BIOS:

INTEGRATED PERIPHERALS -> Onboard Legacy Audio -> Sound Blaster (Disable -> Enable)

Chipset Feature Setup ->On Chip Sound (Disable-> Enable)

The Sound Blaster Pro compatible sound chip is integrated into the VIA PCI audio device in order to have Sound Blaster compatible DOS games running on the system.

If you want to play Sound Blaster compatible DOS games under the real mode MS-DOS or the "Restart in MS-DOS" from Win9x, then you should run this setup program to enable OPL3 MIDI music. Otherwise, the sound effects will be heard, but not the music. If you want to play legacy games in a Windows DOS Box, then you don't need to install this program.

6.2.2 VIA Sound Blaster Installation

Follow these steps to enable the Sound Blaster Pro compatible functions.

- Step 1. Enable the Sound Blaster first on the BIOS setting of the "Onboard Legacy Audio" and "On-Chip Sound".
- Step 2. Run the "Install.exe". A:> INSTALL

- Step 3. The program will copy the relative files into the directory which you assign. Next, the program will insert the following new line into the AUTOEXEC.BAT and copy the original AUTOEXEC.BAT to AUTOEXEC.VIA.
 - C: \VIAUDIO\VIAUDIO.COM
- Step 4. Reboot the system when the installation is complete.
- Step 5. Uninstall by deleting the new line from the AUTOEXEC.BAT.

6.3 Driver installation

6.3.1 Before you begin

Please read the instructions in this chapter carefully before you attempt installation. The audio drivers for the PCI-6871 board are located on the audio driver CD. Run the supplied SETUP program to install the drivers; don't copy the files manually.

Note: The files on the software installation diskette are compressed. Do not attempt to install the drivers by copying the files manually. You must use the supplied SETUP program to install the drivers.

6.3.2 Windows 95/98 drivers

Step 1. Click "Start" and select "Settings". Click "Control Panel" and double-click "Add New Hardware".

Step 2. In the Add New Hardware Wizard window, click "Next".

Step 3. In the following Add New Hardware Wizard window, click "Next" for Windows to search for Plug and Play devices.

CHAPTER

PCI Bus Ethernet Interface

This chapter provides information on Ethernet configuration.

- Introduction
- Installation of Ethernet drivers for Windows 98/2000/NT
- Further information

Chapter 7 PCI Bus Ethernet Interface

7.1 Introduction

The PCI-6871 is equipped with a high performance 32-bit Ethernet chipset which is fully compliant with IEEE 802.3 100 Mbps CSMA/CD standards. It is supported by major network operating systems. It is also both 100Base-T and 10Base-T compatible. The medium type can be configured via the RSET8139.exe program included on the utility disk.

7.2 Installation of Ethernet driver

Before installing the Ethernet driver, note the procedures below. You must know which operating system you are using in your PCI-6871 Series, and then refer to the corresponding installation flow chart. Then just follow the steps described in the flow chart. You will quickly and successfully complete the installation, even if you are not familiar with instructions for MS-DOS or Windows.

Note: The windows illustrations in this chapter are examples only. Follow the steps and pay attention to the instructions which appear on your screen.

7.2.1 Installation for MS-DOS and Windows 3.1

If you want to set up your Ethernet connection under the MS-DOS or Windows 3.1 environment, you should first check your server system model. For example, MS-NT, IBM-LAN server, and so on.

Then choose the correct driver to install in your biscuit PC.

The installation procedures for various servers can be found on the supplied CD-ROM, the correct path being:

D:\slotPC\6871\LAN\8139C\wfw311

7.2.2 Installation for Windows 98

Step 1. a. Select "Start", "Settings". "Control Panel".b. Double click "Network".

Step 2. a. Click "Add" and prepare to install network functions.

Network	? X
Configuration	
The following network components are installed:

PCI-6871 User's Manual

Programming the Watchdog Timer

The PCI-6871 is equipped with a watchdog timer that resets the CPU or generates an interrupt if processing comes to a standstill for any reason. This feature ensures system reliability in industrial standalone or unmanned environments.

Appendix A Programming the Watchdog Timer

A.1 Supported Input Timing Modes

In order to program the watchdog timer, you must write a program which writes I/O port address 443 (hex). The output data is a value of time interval. The value range is from 01 (hex) to 3E (hex), and the related time interval is 1 sec. to 62 sec.

Data	Time Interval
01	1 sec.
02	2 sec.
03	3 sec.
04	4 sec.
	•
3E	62 sec.

After data entry, your program must refresh the watchdog timer by rewriting the I/O port 443 (hex) while simultaneously setting it. When you want to disable the watchdog timer, your program should read I/O port 443 (hex).

The following example shows how you might program the watchdog timer in BASIC:

10	REM Watchdog timer example program
20	OUT &H443, data REM Start and restart the watchdog
30	GOSUB 1000 REM Your application task #1
40	OUT &H443, data REM Reset the timer
50	GOSUB 2000 REM Your application task #2
60	OUT &H443, data REM Reset the timer
70	X=INP (&H443) REM Disable the watchdog timer
80	END
1000	REM Subroutine #1, your application task
	•
	•
	•
1070	RETURN
2000	REM Subroutine #2, your application task
	•
	•
	•
2090	RETURN

Installing PC/104 Modules

This appendix gives instructions for installing PC/104 modules.

Appendix B Installing PC/104 Modules

B.1 Installing PC/104 Modules

The PCI-6871's PC/104 connectors give you the flexibility to attach PC/ 104 modules.

Installing these modules on the PCI-6871 is quick and simple. The following steps show how to mount the PC/104 modules:

- 1. Remove the PCI-6871 from your system, paying particular attention to the safety instructions already mentioned above.
- 2. Make any jumper or link changes required to the CPU card now. Once the PC/104 module is mounted, you may have difficulty in accessing these.
- 3. Normal PC/104 modules have male connectors and mount directly onto the main card. (Refer to the diagram on the following page.)
- 4. Mount the PC/104 module onto the CPU card by pressing the module firmly but carefully onto the mounting connectors.
- 5. Secure the PC/104 module onto the CPU card using the four mounting spacers and screws.

Figure B.1: PC/104 module mounting diagram

Figure B.2: PC/104 module dimensions (mm) (±0.1)

Pin Assignments

This appendix contains information of a detailed or specialized nature. It includes:

- CPU Fan Power Connector
- Ethernet 10/100Base-T Connector
- Audio Connector
- Main Power Connector
- Keyboard and PS/2 Mouse Connector
- Floppy Drive Connector
- IDE (1st and 2nd) HDD Connector
- Parallel Port Connector
- Power & HDD LED, Reset Button Connector
- USB Connector
- Backlight Connector
- IR Connector
- CRT Display Connector
- Flat Panel Connector
- Ext. Flat Panel Connector
- LCD Signal Mapping
- LVDS Interface Connector
- COM Port Connector
- CompactFlash Card Connector
- ATX Power Feature Connector
- DIO Connector
- LCD back light Connector
- EXT_KB Connector

System Assignments

This appendix contains information of a detailed nature. It includes:

- System I/O ports
- 1st MB memory map
- DMA channel assignments
- Interrupt assignments

Appendix D System Assignments

D.1 System I/O Ports

Table D.1: System I/O ports		
Addr. range (Hex)	Device	
000-01F	DMA controller	
020-021	Interrupt controller 1, master	
040-05F	8254 timer	
060-06F	8042 (keyboard controller)	
070-07F	Real-time clock, non-maskable interrupt (NMI) mask	
080-09F	DMA page register	
0A0-0BF	Interrupt controller 2	
0C0-0DF	DMA controller	
0F0	Clear math co-processor	
0F1	Reset math co-processor	
0F8-0FF	Math co-processor	
1F0-1F8	Fixed disk	
200-207	Reserved (Game I/O)	
278-27F	Parallel printer port 2 (LPT 3)	
2E8-2EF	Series port 4	
2F8-2FF	Serial port 2	
300-31F	Prototype card	
360-36F	Reserved	
378-37F	Parallel printer port 1 (LPT 2)	
380-38F	SDLC, bisynchronous 2	
3A0-3AF	Bisynchronous 1	
3B0-3BF	Monochrome display and printer adapter (LPT1)	
3C0-3CF	Reserved	
3D0-3DF	Color/graphics monitor adapter	
3E8-3EF	Series port 3	
3F0-3F7	Diskette controller	
3F8-3FF	Serial port 1	

* PNP audio I/O map range from 220 ~ 250H (16 bytes)
 MPU-401 select from 300 ~ 330H (2 bytes)

D.2 1st MB memory map

Table D.2: 1st MB memory map		
Addr. range (Hex)	Device	
F0000h - FFFFFh	System ROM	
*CC000h - EFFFFh	Unused (reserved for Ethernet ROM)	
C0000h - CBFFFh	Expansion ROM (for VGA BIOS)	
B8000h - BFFFFh	CGA/EGA/VGA text	
B0000h - B7FFFh	Unused	
A0000h - AFFFFh	EGA/VGA graphics	
00000h - 9FFFFh	Base memory	

* If Ethernet boot ROM is disabled (Ethernet ROM occupies about 16 KB)

* E0000 - EFFFF is reserved for BIOS POST

D.3 DMA channel assignments

Table D.3: DMA channel assignments		
Channel	Function	
0	Available	
1	Available (audio)	
2	Floppy disk (8-bit transfer)	
3	Available (parallel port)	
4	Cascade for DMA controller 1	
5	Available	
6	Available	
7	Available	

* Audio DMA select 1, 3, or 5

** Parallel port DMA select 1 (LPT2) or 3 (LPT1)

D.4 Interrupt assignments

Table D.4: Interrupt assignments	
Interrupt source	
Interval timer	
Keyboard	
Interrupt from controller 2 (cascade)	
COM2	
COM1	
COM4	
FDD	
LPT1	
RTC	
Reserved (audio)	
COM3	
Reserved for watchdog timer	
PS/2 mouse	
INT from co-processor	
Primary IDE	
Secondary IDE for CFC	

* Ethernet interface IRQ select: 9, 11, 15

* PNP audio IRQ select: 9, 11, 15

* PNP USB IRQ select: 9, 11, 15

* PNP ACPI IRQ select: 9, 11, 15

Optional Extras for the PCI-6871

E.1 Optional USB cable (CN20)

Optional USB cable (2.0mm)

part no.: 1703100260

E.2 ATX Power Control Cable

part no.: 1703200100

E.3 Audio module

Audio module with Line-in, Line out, mic

part no.: PCM-231A-00A1
