IBM Mobile Systems

S82G-1502-03

**Hardware Maintenance Manual
Volume 2: ThinkPad Computers**

April 1995

**We Want Your Comments!
(Please see page 491)**

This Manual Supports:

- ThinkPad 340x (2610)
- ThinkPad 355x (2619)
- ThinkPad 360x (2620)
- ThinkPad 370x (9545)
- ThinkPad 700x (9552)
- ThinkPad 701x (2630)
- ThinkPad 720x (9552)
- ThinkPad 750x (9545)
- ThinkPad 755x (9545)

About This Manual

This manual contains service and reference information for IBM* ThinkPad* computer products. Use this manual along with the advanced diagnostic tests to troubleshoot problems effectively.

The manual is divided into sections as follows:

- The Introduction section provides general information, guidelines, and safety information required to service computers.
- The majority of the manual consists of product-specific sections that include service, reference, and product-specific parts information.
- The Common Devices Checkout section provides procedures for testing the devices that are commonly attached to ThinkPad computers.
- The Miscellaneous Information section contains information about acronyms, abbreviations, terms, and a telephone number listing.

Important

This manual is intended for trained servicers who are familiar with ThinkPad products. Use this manual along with the advanced diagnostic tests to troubleshoot problems effectively.

Before servicing an IBM mobile product, be sure to review the safety information under “Safety Notices (Multi-lingual Translations)” on page 7 and “Safety Information” on page 14.

Drive and Diskette Compatibility Matrix

The following table provides identification information for 3.5-inch drives.

Diskette Drive	Identifying Mark
3.5-Inch - 1.44MB	1.44 on the eject button
3.5-Inch - 2.88MB	2.88 on the eject button

The following table provides compatibility information for 3.5-inch diskettes and 3.5-inch diskette drives.

Diskette Capacity	1.44MB Drive	2.88MB Drive
1.0MB	Read/Write	Read/Write
2.0MB	Read/Write	Read/Write
4.0MB	Not Compatible	Read/Write

The following table provides identification information for 5.25-inch diskette drives.

Diskette Drive	Identifying Mark
5.25-Inch - 360KB (External)	Asterisk on bezel
5.25-Inch - 1.2MB (Internal)	1.2 on the eject button

The following table provides compatibility information for 5.25-inch diskettes and 5.25-inch diskette drives.

Diskette Capacity	360KB Drive	1.2MB Drive
360KB	Read/Write	Read/Write
1.2MB	Not Compatible	Read/Write

Note: A 360KB diskette written to or formatted on a 1.2MB drive can be read reliably only on a 1.2MB drive.

Important Service Information

Important

Diskette fixes are customer installable. The diskette fixes are located on the PC Company Bulletin Board Service (BBS). The direct phone line for modem connection is 919-557-0001 or tieline 255-0001.

Advise customers to contact the PC Company HelpCenter at 800-772-2227 if they need assistance in obtaining or installing any diskette fixes.

Customers in Canada should call IBM HelpPC at 800-565-3344 for assistance or down-load information. The Canadian BBS phone numbers are:

Montreal 514-938-3022

Toronto 905-316-4255

Vancouver 604-664-6464

Winnipeg 204-934-2735

FRU Replacement Strategy

Before Replacing Parts

Ensure that all diskette fixes are installed prior to replacing any FRUs listed in this manual.

Use the following strategy to prevent unnecessary FRU replacement and service expense:

- **If you are instructed to replace a FRU and that does not correct the problem, reinstall the original FRU before you continue.**
- Some computers have both a processor board and a system board. If you are instructed to replace either the processor board or the system board, and the first board that you replaced does not correct the problem, reinstall the original board, then replace the other (processor or system) board.
- If an adapter or device consists of more than one FRU, an error code may be caused by any of the FRUs. Before replacing the adapter or device, remove the FRUs, one by one, to see if the symptoms change. Replace only the FRU that changed the symptoms.

Warning: A customized setup configuration (other than default settings) may exist on the computer you are servicing. Running Automatic Configuration may alter those settings. Note the current configuration settings (using the View Configuration option) and verify that the settings are in place when service is complete.

The advanced diagnostic tests are intended to test *only* IBM products. Non-IBM products or modified options can give false errors and invalid responses.

Hard Disk Drive Replacement Strategy:

Always try to run a low-level format before replacing a hard disk drive.

Warning: The drive startup sequence in the computer you are servicing might have been changed. Be extremely careful during write operations such as copying, saving, or formatting. Data or programs can be overwritten if you select an incorrect drive.

How to Use Error Messages

Use the error codes displayed on the screen to diagnose failures. If more than one error code is displayed, begin the diagnosis with the first error code. The cause of the first error code can result in false error codes being displayed. If no error code is displayed, see if the error symptom is listed in the Symptom-to-FRU Index for the computer you are servicing.

How to Read POST Error Messages

POST error messages are displayed on the screen as three, four, five, or eight digits. The error messages that can be displayed as shorter POST messages are highlighted in this index. Some digits will represent different information for SCSI errors versus non-SCSI errors.

The following example shows which digits display the shorter POST error messages and also defines the SCSI information in an eight-digit error message.

All SCSI devices are set to a different SCSI ID. Duplicate SCSI ID settings can generate a false error message. Use the SCSI ID to determine whether the error message is coming from an internal or an external device.

Safety Notices (Multi-lingual Translations)

In this manual, safety notices appear in English with a page number reference to the appropriate multi-lingual, translated safety notice found in this section.

The following safety notices are provided in English, French, German, Italian, and Spanish languages.

Safety Notice 1

Before the computer is powered-on after FRU replacement, make sure all screws, springs, or other small parts are in place and are not left loose inside the computer. Verify this by shaking the computer and listening for rattling sounds. Metallic parts or metal flakes can cause electrical shorts.

Avant de remettre l'ordinateur sous tension après remplacement d'une unité en clientèle, vérifiez que tous les ressorts, vis et autres pièces sont bien en place et bien fixées. Pour ce faire, secouez l'unité et assurez-vous qu'aucun bruit suspect ne se produit. Des pièces métalliques ou des copeaux de métal pourraient causer un court-circuit.

Bevor nach einem FRU-Austausch der Computer wieder angeschlossen wird, muß sichergestellt werden, daß keine Schrauben, Federn oder andere Kleinteile fehlen oder im Gehäuse vergessen wurden. Der Computer muß geschüttelt und auf Klappergeräusche geprüft werden. Metallteile oder -splitter können Kurzschlüsse erzeugen.

Prima di accendere l'elaboratore dopo che é stata effettuata la sostituzione di una FRU, accertarsi che tutte le viti, le molle e tutte le altri parti di piccole dimensioni siano nella corretta posizione e non siano sparse all'interno dell'elaboratore. Verificare ciò scuotendo l'elaboratore e prestando attenzione ad eventuali rumori; eventuali parti o pezzetti metallici possono provocare cortocircuiti pericolosi.

Antes de encender el sistema despues de sustituir una FRU, compruebe que todos los tornillos, muelles y demás piezas pequeñas se encuentran en su sitio y no se encuentran sueltas dentro del sistema. Compruébelo agitando el sistema y escuchando los posibles ruidos que provocarían. Las piezas metálicas pueden causar cortocircuitos eléctricos.

Safety Notice 2

Some standby batteries contain a small amount of nickel and cadmium. Do not disassemble it, recharge it, throw it into fire or water, or short-circuit it. Dispose of the battery as required by local ordinances or regulations. Use only the battery in the appropriate parts listing. Use of an incorrect battery can result in ignition or explosion of the battery.

Certaines batteries de secours contiennent du nickel et du cadmium. Ne les démontez pas, ne les rechargez pas, ne les exposez ni au feu ni à l'eau. Ne les mettez pas en court-circuit. Pour les mettre au rebut, conformez-vous à la réglementation en vigueur. Lorsque vous remplacez la pile de sauvegarde ou celle de l'horloge temps réel, veillez à n'utiliser que les modèles cités dans la liste de pièces détachées adéquate. Une batterie ou une pile inappropriée risque de prendre feu ou d'exploser.

Die Bereitschaftsbatterie, die sich unter dem Diskettenlaufwerk befindet, kann geringe Mengen Nickel und Cadmium enthalten. Sie darf nur durch die Verkaufsstelle oder den IBM Kundendienst ausgetauscht werden. Sie darf nicht zerlegt, wiederaufgeladen, kurzgeschlossen, oder Feuer oder Wasser ausgesetzt werden. Die Batterie kann schwere Verbrennungen oder Verätzungen verursachen. Bei der Entsorgung die örtlichen Bestimmungen für Sondermüll beachten. Beim Ersetzen der Bereitschafts- oder Systembatterie nur Batterien des Typs verwenden, der in der Ersatzteilliste aufgeführt ist. Der Einsatz falscher Batterien kann zu Entzündung oder Explosion führen.

Alcune batterie di riserva contengono una piccola quantità di nichel e cadmio. Non smontarle, ricaricarle, gettarle nel fuoco o nell'acqua né cortocircuitarle. Smaltirle secondo la normativa in vigore (DPR 915/82, successive disposizioni e disposizioni locali). Quando si sostituisce la batteria dell'RTC (real time clock) o la batteria di supporto, utilizzare soltanto i tipi inseriti nell'appropriato Catalogo parti. L'impiego di una batteria non adatta potrebbe determinare l'incendio o l'esplosione della batteria stessa.

Algunas baterías de reserva contienen una pequeña cantidad de níquel y cadmio. No las desmonte, ni recargue, ni las eche al fuego o al agua ni las cortocircuite. Deséchelas tal como dispone la normativa local. Utilice sólo baterías que se encuentren en la lista de piezas. La utilización de una batería no apropiada puede provocar la ignición o explosión de la misma.

Safety Notice 3

The battery pack contains small amounts of nickel. Do not disassemble it, throw it into fire or water, or short-circuit it. Dispose of the battery pack as required by local ordinances or regulations. Use only the battery in the appropriate parts listing when replacing the battery pack. Use of an incorrect battery can result in ignition or explosion of the battery.

La batterie contient du nickel. Ne la démontez pas, ne l'exposez ni au feu ni à l'eau. Ne la mettez pas en court-circuit. Pour la mettre au rebut, conformez-vous à la réglementation en vigueur. Lorsque vous remplacez la batterie, veillez à n'utiliser que les modèles cités dans la liste de pièces détachées adéquate. En effet, une batterie inappropriée risque de prendre feu ou d'exploser.

Akkus enthalten geringe Mengen von Nickel. Sie dürfen nicht zerlegt, wiederaufgeladen, kurzgeschlossen, oder Feuer oder Wasser ausgesetzt werden. Bei der Entsorgung die örtlichen Bestimmungen für Sondermüll beachten. Beim Ersetzen der Batterie nur Batterien des Typs verwenden, der in der Ersatzteilliste aufgeführt ist. Der Einsatz falscher Batterien kann zu Entzündung oder Explosion führen.

La batteria contiene piccole quantità di nichel. Non smontarla, gettarla nel fuoco o nell'acqua né cortocircuitarla. Smaltirla secondo la normativa in vigore (DPR 915/82, successive disposizioni e disposizioni locali). Quando si sostituisce la batteria, utilizzare soltanto i tipi inseriti nell'appropriato Catalogo parti. L'impiego di una batteria non adatta potrebbe determinare l'incendio o l'esplosione della batteria stessa.

Las baterías contienen pequeñas cantidades de níquel. No las desmonte, ni recargue, ni las eche al fuego o al agua ni las cortocircuite. Deséchelas tal como dispone la normativa local. Utilice sólo baterías que se encuentren en la lista de piezas al sustituir la batería. La utilización de una batería no apropiada puede provocar la ignición o explosión de la misma.

Safety Notice 4

The lithium battery can cause a fire, explosion, or severe burn. Do not recharge it, remove its polarized connector, disassemble it, heat it above 100°C (212°F), incinerate it, or expose its cell contents to water. Dispose of the battery as required by local ordinances or regulations. Use only the battery in the appropriate parts listing. Use of an incorrect battery can result in ignition or explosion of the battery.

La pile de sauvegarde contient du lithium. Elle présente des risques d'incendie, d'explosion ou de brûlures graves. Ne la rechargez pas, ne retirez pas son connecteur polarisé et ne la démontez pas. Ne l'exposez pas à une température supérieure à 100°C, ne la faites pas brûler et n'en exposez pas le contenu à l'eau. Mettez la pile au rebut conformément à la réglementation en vigueur. Une pile inappropriée risque de prendre feu ou d'exploser.

Die Systematterie ist eine Lithiumatterie. Sie kann sich entzünden, explodieren oder schwere Verbrennungen hervorrufen. Batterien dieses Typs dürfen nicht aufgeladen, zerlegt, über 100 C erhitzt oder verbrannt werden. Auch darf ihr Inhalt nicht mit Wasser in Verbindung gebracht oder der zur richtigen Polung angebrachte Verbindungsstecker entfernt werden. Bei der Entsorgung die örtlichen Bestimmungen für Sondermüll beachten. Beim Ersetzen der Batterie nur Batterien des Typs verwenden, der in der Ersatzteilliste aufgeführt ist. Der Einsatz falscher Batterien kann zu Entzündung oder Explosion führen.

La batteria di supporto è una batteria al litio e può incendiarsi, esplodere o procurare gravi ustioni. Evitare di ricaricarla, smontarne il connettore polarizzato, smontarla, riscaldarla ad una temperatura superiore ai 100 gradi centigradi, incendiarla o gettarla in acqua. Smaltirla secondo la normativa in vigore (DPR 915/82, successive disposizioni e disposizioni locali). L'impiego di una batteria non adatta potrebbe determinare l'incendio o l'esplosione della batteria stessa.

La batería de repuesto es una batería de litio y puede provocar incendios, explosiones o quemaduras graves. No la recargue, ni quite el conector polarizado, ni la desmonte, ni caliente por encima de los 100°C (212°F), ni la incinere ni exponga el contenido de sus celdas al agua. Deséchela tal como dispone la normativa local.

Safety Notice 5

If the LCD breaks and the fluid from inside the LCD gets into your eyes or on your hands, immediately wash the affected areas with water for at least 15 minutes. Seek medical care if any symptoms from the fluid are present after washing.

Si le panneau d'affichage à cristaux liquides se brise et que vous recevez dans les yeux ou sur les mains une partie du fluide, rincez-les abondamment pendant au moins quinze minutes. Consultez un médecin si des symptômes persistent après le lavage.

Die Leuchtstoffröhre im LCD-Bildschirm enthält Quecksilber. Bei der Entsorgung die örtlichen Bestimmungen für Sondermüll beachten. Der LCD-Bildschirm besteht aus Glas und kann zerbrechen, wenn er unsachgemäß behandelt wird oder der Computer auf den Boden fällt. Wenn der Bildschirm beschädigt ist und die darin befindliche Flüssigkeit in Kontakt mit Haut und Augen gerät, sollten die betroffenen Stellen mindestens 15 Minuten mit Wasser abgespült und bei Beschwerden anschließend ein Arzt aufgesucht werden.

Nel caso che caso l'LCD si dovesse rompere ed il liquido in esso contenuto entrasse in contatto con gli occhi o le mani, lavare immediatamente le parti interessate con acqua corrente per almeno 15 minuti; poi consultare un medico se i sintomi dovessero permanere.

Si la LCD se rompe y el fluido de su interior entra en contacto con sus ojos o sus manos, lave inmediatamente las áreas afectadas con agua durante 15 minutos como mínimo. Obtenga atención medica si se presenta algún síntoma del fluido despues de lavarse.

Safety Notice 6

To avoid shock, do not remove the plastic cover that surrounds the lower portion of the inverter card.

Afin d'éviter tout risque de choc électrique, ne retirez pas le cache en plastique protégeant la partie inférieure de la carte d'alimentation.

Aus Sicherheitsgründen die Kunststoffabdeckung, die den unteren Teil der Spannungswandlerplatine umgibt, nicht entfernen.

Per evitare scosse elettriche, non rimuovere la copertura in plastica che avvolge la parte inferiore della scheda invertitore.

Para evitar descargas, no quite la cubierta de plástico que rodea la parte baja de la tarjeta invertida.

Safety Notice 7

Though main batteries have low voltage, a shorted or grounded battery can produce enough current to burn combustible materials or personnel.

Bien que le voltage des batteries principales soit peu élevé, le court-circuit ou la mise à la masse d'une batterie peut produire suffisamment de courant pour brûler des matériaux combustibles ou causer des brûlures corporelles graves.

Obwohl Hauptbatterien eine niedrige Spannung haben, können sie doch bei Kurzschluß oder Erdung genug Strom abgeben, um brennbare Materialien zu entzünden oder Verletzungen bei Personen hervorzurufen.

Sebbene le batterie di alimentazione siano a basso voltaggio, una batteria in corto circuito o a massa può fornire corrente sufficiente da bruciare materiali combustibili o provocare ustioni ai tecnici di manutenzione.

Aunque las baterías principales tienen un voltaje bajo, una batería cortocircuitada o con contacto a tierra puede producir la corriente suficiente como para quemar material combustible o provocar quemaduras en el personal.

Safety Notice 8

Before removing any FRU, power-off the computer, unplug all power cords from electrical outlets, remove the battery pack, then disconnect any interconnecting cables.

Avant de retirer une unité remplaçable en clientèle, mettez le système hors tension, débranchez tous les cordons d'alimentation des socles de prise de courant, retirez la batterie et déconnectez tous les cordons d'interface.

Die Stromzufuhr muß abgeschaltet, alle Stromkabel aus der Steckdose gezogen, der Akku entfernt und alle Verbindungskabel abgenommen sein, bevor eine FRU entfernt wird.

Prima di rimuovere qualsiasi FRU, spegnere il sistema, scollegare dalle prese elettriche tutti i cavi di alimentazione, rimuovere la batteria e poi scollegare i cavi di interconnessione.

Antes de quitar una FRU, apague el sistema, desenchufe todos los cables de las tomas de corriente eléctrica, quite la batería y, a continuación, desconecte cualquier cable de conexión entre dispositivos.

Safety Information

The following section contains the safety information that you need to be familiar with before servicing an IBM mobile computer.

General Safety

Follow these rules to ensure general safety:

- Observe good housekeeping in the area of the machines during and after maintenance.
- When lifting any heavy object:
 1. Ensure you can stand safely without slipping.
 2. Distribute the weight of the object equally between your feet.
 3. Use a slow lifting force. Never move suddenly or twist when you attempt to lift.
 4. Lift by standing or by pushing up with your leg muscles; this action removes the strain from the muscles in your back. *Do not attempt to lift any objects that weigh more than 16 kg (35 lb) or objects that you think are too heavy for you.*
- Do not perform any action that causes hazards to the customer, or that makes the equipment unsafe.
- Before you start the machine, ensure that other service representatives and the customer's personnel are not in a hazardous position.
- Place removed covers and other parts in a safe place, away from all personnel, while you are servicing the machine.
- Keep your tool case away from walk areas so that other people will not trip over it.
- Do not wear loose clothing that can be trapped in the moving parts of a machine. Ensure that your sleeves are fastened or rolled up above your elbows. If your hair is long, fasten it.
- Insert the ends of your necktie or scarf inside clothing or fasten it with a nonconductive clip, approximately 8 centimeters (3 inches) from the end.
- Do not wear jewelry, chains, metal-frame eyeglasses, or metal fasteners for your clothing.

Remember: Metal objects are good electrical conductors.

- Wear safety glasses when you are: hammering, drilling soldering, cutting wire, attaching springs, using solvents, or working in any other conditions that might be hazardous to your eyes.
- After service, reinstall all safety shields, guards, labels, and ground wires. Replace any safety device that is worn or defective.
- Reinstall all covers correctly before returning the machine to the customer.

Electrical Safety

Observe the following rules when working on electrical equipment.

Important

Use only approved tools and test equipment. Some hand tools have handles covered with a soft material that does not insulate you when working with live electrical currents.

Many customers have, near their equipment, rubber floor mats that contain small conductive fibers to decrease electrostatic discharges. Do not use this type of mat to protect yourself from electrical shock.

- Find the room emergency power-off (EPO) switch, disconnecting switch, or electrical outlet. If an electrical accident occurs, you can then operate the switch or unplug the power cord quickly.
- Do not work alone under hazardous conditions or near equipment that has hazardous voltages.
- Disconnect all power before:
 - Performing a mechanical inspection
 - Working near power supplies
 - Removing or installing main units
- Before you start to work on the machine, unplug the power cord. If you cannot unplug it, ask the customer to power-off the wall box that supplies power to the machine and to lock the wall box in the off position.
- If you need to work on a machine that has *exposed* electrical circuits, observe the following precautions:
 - Ensure that another person, familiar with the power-off controls, is near you.

Remember: Another person must be there to switch off the power, if necessary.
 - Use only one hand when working with powered-on electrical equipment; keep the other hand in your pocket or behind your back.

Remember: There must be a complete circuit to cause electrical shock. By observing the above rule, you may prevent a current from passing through your body.
 - When using testers, set the controls correctly and use the approved probe leads and accessories for that tester.
 - Stand on suitable rubber mats (obtained locally, if necessary) to insulate you from grounds such as metal floor strips and machine frames.

Observe the special safety precautions when you work with very high voltages; these instructions are in the safety sections of maintenance information. Use extreme care when measuring high voltages.

- Regularly inspect and maintain your electrical hand tools for safe operational condition.
- Do not use worn or broken tools and testers.
- *Never assume* that power has been disconnected from a circuit. First, *check* that it has been powered-off.
- Always look carefully for possible hazards in your work area. Examples of these hazards are moist floors, nongrounded power extension cables, power surges, and missing safety grounds.
- Do not touch live electrical circuits with the reflective surface of a plastic dental mirror. The surface is conductive; such touching can cause personal injury and machine damage.
- Do not service the following parts *with the power on* when they are removed from their normal operating places in a machine:
 - Power supply units
 - Pumps
 - Blowers and fans
 - Motor generators

and similar units. (This practice ensures correct grounding of the units.)

- If an electrical accident occurs:
 - **Use caution; do not become a victim yourself.**
 - **Switch off power.**
 - **Send another person to get medical aid.**

Safety Inspection Guide

The intent of this inspection guide is to assist you in identifying potentially unsafe conditions on these products. Each machine, as it was designed and built, had required safety items installed to protect users and service personnel from injury. This guide addresses only those items. However, good judgment should be used to identify potential safety hazards due to attachment of non-IBM features or options not covered by this inspection guide.

If any unsafe conditions are present, you must determine how serious the apparent hazard could be and whether you can continue without first correcting the problem.

Consider these conditions and the safety hazards they present:

- Electrical hazards, especially primary power (primary voltage on the frame can cause serious or fatal electrical shock).
- Explosive hazards, such as a damaged CRT face or bulging capacitor
- Mechanical hazards, such as loose or missing hardware

The guide consists of a series of steps presented in a checklist. Begin the checks with the power off, and the power cord disconnected.

Checklist:

1. Check exterior covers for damage (loose, broken, or sharp edges).
2. Power-off the computer. Disconnect the power cord.
3. Check the power cord for:
 - a. A third-wire ground connector in good condition. Use a meter to measure third-wire ground continuity for 0.1 ohm or less between the external ground pin and frame ground.
 - b. The power cord should be the appropriate type as specified in the parts listings.
 - c. Insulation must not be frayed or worn.
4. Remove the cover.
5. Check for any obvious non-IBM alterations. Use good judgment as to the safety of any non-IBM alterations.
6. Check inside the unit for any obvious unsafe conditions, such as metal filings, contamination, water or other liquids, or signs of fire or smoke damage.
7. Check for worn, frayed, or pinched cables.
8. Check that the power-supply cover fasteners (screws or rivets) have not been removed or tampered with.

Handling Electrostatic Discharge-Sensitive Devices

Any computer part containing transistors or integrated circuits (ICs) should be considered sensitive to electrostatic discharge (ESD). ESD damage can occur when there is a difference in charge between objects. Protect against ESD damage by equalizing the charge so that the machine, the part, the work mat, and the person handling the part are all at the same charge.

Notes:

1. Use product-specific ESD procedures when they exceed the requirements noted here.
2. Make sure that the ESD protective devices you use have been certified (ISO 9000) as fully effective.

When handling ESD-sensitive parts:

- Keep the parts in protective packages until they are inserted into the product.
- Avoid contact with other people.
- Wear a grounded wrist strap against your skin to eliminate static on your body.
- Prevent the part from touching your clothing. Most clothing is insulative and retains a charge even when you are wearing a wrist strap.
- Use the black side of a grounded work mat to provide a static-free work surface. The mat is especially useful when handling ESD-sensitive devices.
- Select a grounding system, such as those listed below, to provide protection that meets the specific service requirement.

Note: The use of a grounding system is desirable but not required to protect against ESD damage.

- Attach the ESD ground clip to any frame ground, ground braid, or green-wire ground.
- Use an ESD common ground or reference point when working on a double-insulated or battery-operated system. You can use coax or connector-outside shells on these systems.
- Use the round ground-prong of the AC plug on AC-operated computers.

Grounding Requirements

Electrical grounding of the computer is required for operator safety and correct system function. Proper grounding of the electrical outlet can be verified by a certified electrician.

Laser Compliance Statement

The CD-ROM drive in the ThinkPad computer is a laser product. The CD-ROM drive's classification label (shown below) is located on the drive.

CLASS 1 LASER PRODUCT
LASER KLASSE 1
LUOKAN 1 LASERLAITE
APPAREIL A LASER DE CLASSE 1
KLASSE 1 LASER APPARAT

The CD-ROM drive is certified in the U.S. to conform to the requirements of the Department of Health and Human Services 21 Code of Federal Regulations (DHHS 21 CFR) Subchapter J for Class 1 laser products.

In other countries, the drive is certified to conform to the requirements of EN60825.

CAUTION:

Do not open the drive; no user adjustments or serviceable parts are inside.

Class 1 laser products are not considered to be hazardous. The CD-ROM drive has an internal Class I (1), 0.5-milliwatt, aluminum gallium-arsenide laser that operates at a wavelength of 760 to 810 nanometers.

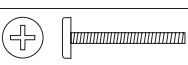

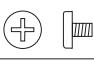

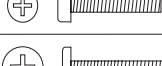

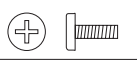

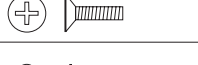

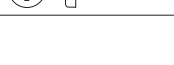

The design of the laser system and the CD-ROM drive ensures that there is no exposure to laser radiation above a Class 1 (1) level during normal operation, user maintenance, or servicing conditions.

Screw Size Chart

Use the chart below to match the size and shape of the screws used in the computer you are servicing.

General Checkout

Use the following procedure as a guide for computer problems. The diagnostic tests are intended to test *only* IBM products. Non-IBM products, prototype cards, or modified options can give false errors and invalid system responses.

1. Obtain the failing symptoms in as much detail as possible.
2. Verify the symptom. Attempt to recreate the failure by running the diagnostic tests or retrying the same operation.

Note: To run the diagnostics, refer to “How to Run the Diagnostics” on page 45.

3. Use the following table with the verified symptom to determine which page to go to. Search the symptoms column and find the description that best matches your symptom; then go to the page shown in the “Go to” column.

Symptom	Go to
Power failure. (The power indicator does not go on or stay on.)	“Power Systems Checkout” on page 29.
POST does not complete. No beeps/error code are indicated.	“Symptom-to-FRU Index” on page 34, and then use the No Beep Symptoms table.
POST beeps, but no error codes are displayed.	“Symptom-to-FRU Index” on page 34, and then use the Beep Symptoms table.
POST detected an error and displayed numeric error codes.	“Symptom-to-FRU Index” on page 34, and then use the Numeric Error Codes table.
The diagnostic test detected an error and displayed an FRU code.	“FRU Codes” on page 37.
The configuration is not the same as the installed devices.	“Checking the Installed Devices List” on page 46.
Other symptoms (such as LCD display problems).	“Symptom-to-FRU Index” on page 34, and then use the table for related symptoms.
Symptoms cannot be recreated. (Intermittent problems.)	Use the customer reported symptoms and go to “Symptom-to-FRU Index” on page 34.

Memory Checkout

See the following table for the available memory size of each card.

IC DRAM	Memory size
0 MB	3712 KB
2 MB	5760 KB
4 MB	7808 KB
8 MB	11904 KB

Memory errors might stop system operations, show error messages on the screen, or hang the system.

Use the following procedure to isolate memory problems.

Note: Make sure that the memory card is fully installed into the connector. Loose connections can cause errors.

1. Power-off the computer and remove the IC DRAM card from its slot (if installed).
2. Press and hold the F1 key; then power-on the computer. Hold the F1 key down until the Easy-Setup screen appears.
3. Select **Test** and press enter.
4. Select **Memory** and press enter to run the memory test on base memory. If an error appears, replace the system board.
5. Power-off the computer and reinstall the IC DRAM card; then power-on the computer. Verify the memory size; then test the memory. If an error appears, replace the IC DRAM card.

If memory problems occur intermittently, use the loop option to repeat the test. When the test detects an error, an error log is printed on the printer connected to the parallel port. See "Error Log" on page 45 for more information.

System Programs in Flash Memory: System setup programs and diagnostic tests are stored in Flash memory.

Flash Memory Update: A flash memory update is required for the following conditions:

- Connecting the AC Adapter, and installing the *charged* battery pack in the computer.
- New versions of system programs.
- New features or options are added.

To update the flash memory, do the following.

1. Get the appropriate diskette which contains the update.
2. Insert the **System Program Service Diskette** into drive A and power-on the computer.
3. Select **Update system programs** from the menu.

System Board

The processing functions for the computer are performed by the system board. When a numeric code calls out the system board, use the following procedure to isolate the problem.

1. Run the system board test to verify the symptom.
This test verifies the system board. If no error is detected, return to “General Checkout” on page 25.
2. If FRU code 10 appears, replace the system board.
3. Rerun the test to verify the fix.

If above procedure does not correct the problem, go to “Undetermined Problems” on page 42.

Keyboard/Auxiliary Input Device Checkout

Remove the external keyboard if the internal keyboard is to be tested.

If the internal keyboard does not work or an unexpected character appears, make sure that the three flexible cables extending from the keyboard are correctly seated in the connectors on the system board.

If the keyboard cable connection is correct, run the **Keyboard Test** by doing the following:

1. Go to advanced diagnostic menu screen by pressing **Ctrl+A** in the basic diagnostic menu.
2. Press **Ctrl+K**; a layout of the keyboard appears on the screen.
3. Check that when each key is pressed, the key position on the keyboard layout on the screen changes to a black square.

Notes:

- a. When a Fn key is pressed, a black square briefly appears.
- b. Press the Esc key to return to the diagnostic menu.

If the tests detect a keyboard problem, do the following one at a time to correct the problem. Do not replace a non-defective FRU.

- Reseat the three cables.
- Replace the keyboard.
- Replace the system board.

The following auxiliary input devices are supported for this computer.

- Numeric keypad
- Mouse (PS/2 compatible)
- External keyboard (with keyboard/mouse cable)

If any of the above devices do not work, reseal the cable connector and repeat the failing operation.

If the problem does not occur again, recheck the connector.

If the problem is not corrected, replace the device, and then the system board.

TrackPoint II and III Checkout

If the TrackPoint II or III will not work, check the configuration in Easy-Setup by selecting **Keyboard** from the **Config** menu. If the configuration of the TrackPoint II or III is disabled, select **TrackPoint** to enable it.

If this does not correct the TrackPoint II or III problem, continue with the following.

The TrackPoint II or III does automatic compensations to adjust the pointer sensor. During this process, the pointer moves on the screen automatically for a short time. This self-acting pointer movement can occur when a slight, steady pressure is applied to the TrackPoint II or III pointer while the computer is powered on or while the system is running, or re-adjustment is required because the temperature has exceeded its normal operating range. This symptom does not indicate a hardware problem. No service actions are necessary if the pointer movement stops in a short period of time.

If a click button problem or pointing stick problem occurs, do the following:

1. Go to the Easy-Setup screen.
2. Select an item with the pointing stick.
3. Press either the left or right click button.
4. Verify that both buttons work correctly.

If either the pointing stick or the click button will not work, do the following actions one at a time to correct the problem. Do not replace a non-defective FRU.

- Reseat the three keyboard cables.
- Replace the keyboard.
- Replace the system board.

Diskette Drive Test

Do the following to isolate the problem to a controller, drive, or diskette. A scratch, write enabled, non-defective 2HD diskette is required.

Note: Make sure that the diskette does not have more than one label attached to it. Multiple labels can cause damage to the drive or can cause the drive to fail.

1. Do following to select the test device:
 - Select the advanced diagnostic mode and select **Tool**; then select the icon **FDD** and press the

space key. A ✓ mark appears next to the selected icon. Insert the **blank** diskette when instructed.

2. Run the diskette drive test.
 3. If the controller test detects an error, FRU code 10 appears. Replace the system board.
 4. If the controller test runs without errors, the drive read/write tests start automatically.
 5. If the drive test detects an error, FRU code 50 appears. If the diskette itself is known to be good, replace the drive.
- If no errors occur at the FDD position, the drive is not defective.

Power Systems Checkout

To verify the symptom of the problem, power-on the computer using each of the power sources available as follows.

1. Remove the battery pack.
2. Connect the AC Adapter and check that power is supplied.
3. Disconnect the AC Adapter and install the charged battery pack; then check that power is supplied by battery pack.

If you suspect a power problem, see the appropriate power supply check listed below.

- "Checking the AC Adapter."
- "Checking the Battery Pack" on page 30.
- "Checking the Backup Battery" on page 31.
- "Checking the Standby Battery" on page 32.

Checking the AC Adapter: You are here because the computer fails only when the AC Adapter is used. If the power-on indicator does not turn on, check the power cord of the AC Adapter for correct continuity and installation.

1. Unplug the AC Adapter cable from the computer and measure the output voltage at the plug of the AC Adapter cable. See the following figure.

AC Adapter (30W, 40W):

Pin	Voltage (V dc)
1	+17.1 to +18.9
2	Return

AC Adapter (35W):

Pin	Voltage (V dc)
1	+15.5 to +17.0
2	Return

- If the voltage is correct, replace the system board. If the problem is not corrected, go to “Undetermined Problems” on page 42.
 - If the voltage is not correct, go to the next step.
2. Unplug the AC Adapter cable from the ac power outlet and wait five minutes or longer to allow the protection circuit to be fully discharged and initialized.
 3. Plug the AC Adapter cable into the ac power outlet.
 4. Measure the output voltage of the AC Adapter.
 5. If the voltage is still not correct, replace the AC Adapter.

Note: An audible noise from the AC Adapter does not always indicate a defective adapter.

Checking the Battery Pack

1. Power-off the computer.
2. Remove the battery pack and measure the voltage between battery terminals 1 (+) and 4 (-). See the following figure.

Terminal	Voltage (V dc) / Signal	
	340 (NiCd)	340CSE (NiMH)
1	+10.0 to +18.0	+10.0 to +16.0
2	NC	0 Ω+0 ground (-)
3	10 kΩ between ground (-)	
4	Ground (-)	

- If the voltage is less than +10.0 V dc, the battery pack has been discharged or is defective. Recharge the battery. If the recharging does not work, go to Step 5 to check the charging circuit.

If the voltage is still less than +10.0 V dc after the recharging, replace the battery.

- If the voltage is more than +8.0 V dc, measure the resistance between battery terminals 3 and 4. The resistance must be 4 to 30 kilohms.

If the resistance is not correct, replace the battery pack.

If the resistance is correct, replace the system board.

- To check the charging circuit, do the following. Plug in the AC Adapter with the battery pack removed; then power-on the computer.
- Measure the charging voltage between terminals 1 (+) and 4 (-) on the computer.
- If the voltage is less than +10.0 Vdc, replace the system board. If the voltage is more than +10.0 Vdc, the charging circuit is working correctly, replace the battery pack.

Checking the Backup Battery

- Power-off the computer and unplug the AC Adapter from the computer.
- Remove the backup battery.
- Measure the voltage of the backup battery. See the following figure.

Wire	Voltage (V dc)
Red	+2.9 to +3.3
Black	Ground

- If the voltage is correct, replace the system board.
- If the voltage is not correct, the backup battery has been discharged. Replace the backup battery.
- If the backup battery discharges quickly after replacement, replace the system board.

Checking the Standby Battery: Be careful not to cause a short circuit when measuring the voltage.

1. Power-off the computer and unplug the AC Adapter from the computer.
2. Remove the standby battery.
3. Measure the voltage of the standby battery.
 - If the voltage between red and black is 3.5 V dc or greater, the voltage is correct. Go to Step 9 on page 33 to verify standby battery operation.
 - If the voltage is less than 3.5 V dc, go to the next step.
4. Plug the AC Adapter into the computer and power-on the computer.
5. Measure the output voltage at the connector on the system board.

Pin	Voltage (V dc)
+	+4.0
-	Ground

- If the voltage is less than +4.0 V dc, replace the system board.
 - If the voltage is more than +4.0 V dc, power-off the computer, replace the standby battery, and go to the next step.
6. Ensure that the AC Adapter is plugged into the computer; then power-on the computer.
 7. Charging of the standby battery starts. A depleted battery needs approximately 30 minutes to be recharged to the operational voltage of +3.5 V dc.
 8. Unplug the AC Adapter.
 9. Verify the standby battery function by removing and installing the battery pack during suspend mode.

Note: Removing and installing the battery pack during suspend mode should be done within one minute.

The resume operation must start. If the resume operation does not work, switching of power from the battery pack to standby battery will not be correct. Replace the system board.

Power Management Features

Two power management modes are provided by the computer to save power consumption and prolong battery power. For the details of the two modes, see the latest volume of the *Hardware Maintenance Manual* for ThinkPad computers.

Standby Mode: When in standby mode, the following occurs:

- The LCD backlight turns off.
- The hard disk motor stops.

Suspend Mode: When in suspend mode, the following occurs:

- The LCD power is powered-off.
- The hard disk is powered-off.
- The CPU is stopped.

Notes:

1. In the ThinkPad Features Program, the computer can be set to “Will not suspend even if LCD is closed.”
2. When the computer is powered with ac power and is used with one of the following IBM PC cards, the computer enters *standby mode*; the PC card and application program remain active.
 - 3270 Emulation Credit Card Adapter
 - 5250 Emulation Credit Card Adapter
 - Token-Ring 16/4 Credit Card Adapter
 - Credit Card Adapter for Ethernet
3. During the following conditions, the computer cannot enter suspend mode.
 - While the communication link is running.
 - When a serial mouse or other pointing device are selected in the **Config** menu of Easy-Setup.

Symptom-to-FRU Index

The Symptom-to-FRU Index lists the symptoms, errors, and possible causes. (It can be used to help you decide which FRUs to have available when servicing the computer.) The most likely cause is listed first.

Perform the FRU replacement or actions in the sequence shown in the “FRU/Action” column. If a FRU does not solve the problem, put the original part back in the computer and perform the next action.

Numeric error codes show the errors detected in POST or system operation. In the following error codes, **X** can be any number.

If no codes are available, use narrative symptoms.

If the symptom is not listed, go to “Undetermined Problems” on page 42.

Note: For IBM devices not supported by diagnostic codes for the Model 340 and 340CSE, see the manual for that device.

Numeric Error Codes

Symptom/Error	FRU/Action
10X	1. System Board
110	<ol style="list-style-type: none"> 1. Go to “Memory Checkout” on page 26. 2. IC DRAM Card 3. System Board

860X (Pointing device error when TrackPoint II or III is disabled.)	<ol style="list-style-type: none"> 1. External Mouse 2. External Keyboard 3. System Board
861X (Pointing device error when TrackPoint II or III is enabled.)	<ol style="list-style-type: none"> 1. Reseat the keyboard TrackPoint II or III cable. (See “1080 Keyboard Unit” on page 54.) 2. Keyboard 3. External Mouse 4. System Board

Symptom/Error	FRU/Action
I9990301 I9990302 I9990305	<ol style="list-style-type: none"> 1. Reseat the boot device. 2. Check the startup sequence for the correct boot device. 3. Check that the operating system has no failures, and is installed correctly.
I9990303	1. System Board
Other codes not listed above	1. Go to “Undetermined Problems” on page 42.

FRU Codes

If an error is detected by the diagnostic tests, a *four-digit* FRU code is displayed. The FRU code indicates two suspected FRUs. Replace the FRU that is indicated by the *two leftmost digits* first, then replace the FRU indicated by the *two rightmost digits*. No FRU is assigned to code 00. If only one FRU is suspected, the other FRU code is filled with zeros. See the referenced page before replacing the FRU.

FRU Code	FRU/Action
10	System Board
20	Memory (See “Memory Checkout” on page 26.)
30	Reserved
32	External Keyboard
33	External Mouse
40	LCD Assembly
45	External CRT
50	<ol style="list-style-type: none"> 1. Reseat the Diskette Drive 2. Diskette Drive
60	<ol style="list-style-type: none"> 1. Reseat the Hard Disk Drive 2. Hard Disk Drive
81	Internal Modem Card (if installed)
90	Reserved

Note: The device ID and error codes are used to indicate the detail portion of the FRU which caused the error. If replacing a FRU does not correct a problem, see the Device ID or error code from the previous failure. If they have changed, the cause might be because the new FRU is defective or that the FRU was incorrectly installed.

If the problem remains after replacement of the FRUs, go to “Undetermined Problems” on page 42.

Beep Symptoms

Symptom/Error	FRU/Action
Continuous beeps.	1. System Board
One beep and a blank, unreadable, or flashing LCD.	1. Reseat the LCD connector. (See "1090 LCD Assembly" on page 55.) 2. LCD Assembly 3. System Board
One beep, and the message "Unable to access boot source."	1. Reseat the boot device. 2. Boot Device 3. System Board
One long, two short beeps and a blank or unreadable LCD.	1. System Board 2. LCD Assembly
One long beep followed by four short beeps each time the power switch is operated. (System cannot power-on due to low battery voltage.)	1. Connect the AC Adapter or install a fully-charged battery.
One long and one short beep.	1. System Board
One beep every second. (System is shutting down due to low battery voltage.)	1. Connect the AC Adapter or install a fully-charged battery (allows the system to completely shutdown before the battery is charged).
Two short beeps with error codes.	1. POST error. (See "Numeric Error Codes" on page 35.)
Two short beeps with blank screen.	1. System Board

No Beep Symptoms

Symptom/Error	FRU/Action
No beep, power-on indicator not on, and a blank LCD during POST.	1. Go to "Power Systems Checkout" on page 29. 2. System Board 3. Power Sources
No beep, power-on indicator on, and a blank LCD during POST.	1. System Board
No beep, power-on indicator on, and a blinking cursor only during POST.	1. System Board

Symptom/Error	FRU/Action
No beep during POST, but system runs correctly.	<ol style="list-style-type: none"> 1. Turn the volume up and listen to the speaker. 2. Speaker

LCD Related Symptoms

Symptom/Error	FRU/Action
Flicker	<ol style="list-style-type: none"> 1. Do not replace any FRUs. In certain brightness/contrast settings, screen flicker can be seen because of technical limitations.
No beep, power-on indicator on, and a blank LCD during POST.	<ol style="list-style-type: none"> 1. System Board
<ul style="list-style-type: none"> • LCD backlight not working • LCD too dark • LCD brightness cannot be adjusted • LCD contrast cannot be adjusted. 	<ol style="list-style-type: none"> 1. Reseat the LCD connector. (See "1090 LCD Assembly" on page 55.) 2. LCD Assembly
<ul style="list-style-type: none"> • LCD screen unreadable, or • Characters missing pels, or • Screen abnormal, or • Wrong characters displayed. 	<ol style="list-style-type: none"> 1. Reseat the LCD connector. (See "1090 LCD Assembly" on page 55.) 2. System Board 3. LCD Assembly
LCD has extra horizontal or vertical lines displayed.	<ol style="list-style-type: none"> 1. LCD Assembly

LCD FRU Replacement Notice: If missing or discolored dots appear on the LCD, carefully read the following note to determine whether you should replace the LCD.

- **Do not** replace the LCD for defective pixels if dots that are less than half the area of a pixel are defective (a total of 11 dots are allowed).
- The LCD **is not** defective if the dots are functional but are slightly different in color from the immediate, surrounding area or appear as a "stain".

Keyboard/TrackPoint II or III Related Symptoms

Symptom/Error	FRU/Action
Keyboard (one or more keys) does not work, or works intermittently.	<ol style="list-style-type: none"> 1. Reseat the three keyboard cables. 2. Reseat the keytop. Ensure the rubber dome under the keytop is straight and in the correct direction, with the larger radius on the top. 3. Keyboard 4. System Board
TrackPoint II or III does not work.	<ol style="list-style-type: none"> 1. Go to “TrackPoint II and III Checkout” on page 28. 2. Keyboard 3. System Board
Pointer moves automatically or does not work correctly.	<ol style="list-style-type: none"> 1. See “TrackPoint II and III Checkout” on page 28.

Indicator Related Symptoms

Symptom/Error	FRU/Action
Indicator incorrectly remains off or on, but system runs correctly.	<ol style="list-style-type: none"> 1. Reseat the indicator card. 2. Indicator Card 3. System Board
Battery power status indicator blinks from green, yellow, to orange.	<ol style="list-style-type: none"> 1. Check that a correct battery is installed. 2. Battery Pack 3. System Board

Power Related Symptoms

Symptom/Error	FRU/Action
Power shut down during operation.	<ol style="list-style-type: none"> 1. Go to “Power Systems Checkout” on page 29. 2. Battery Pack 3. Remove the battery pack and let it cool for two hours. 4. Power Sources
The system will not power-off. (See “Reset Pushbutton” on page 46.)	<ol style="list-style-type: none"> 1. Press the Reset pushbutton. 2. System Board

Function/Audio Related Symptoms

Symptom/Error	FRU/Action
The system will not suspend or resume by opening or closing the keyboard.	<ol style="list-style-type: none"> 1. Go to “Suspend Mode” on page 34 and check that the computer can enter suspend mode. 2. Go to the Easy-Setup screen and press Fn+4. If the computer enters suspend mode, suspect that the application program is defective. 3. System Board
The system will not suspend or resume by opening or closing the LCD.	<ol style="list-style-type: none"> 1. Go to “Suspend Mode” on page 34 and that check that the computer can enter suspend mode. 2. Go to the Easy-Setup screen and press Fn+4. If the computer enters suspend mode, suspect that the application program is defective. 3. System Board
Battery Fuel-Gauge does not go higher than 90%.	<ol style="list-style-type: none"> 1. Go to “Checking the Battery Pack” on page 30 and see the note.
Modem problems. (If installed)	<ol style="list-style-type: none"> 1. Run the Internal Modem Test. 2. Check that the port is set to enable in Easy Setup. 3. Check that the port power is switched on by PS2.EXE. 4. Modem Card (if installed)
Memory count (size) appears differently from actual size.	<ol style="list-style-type: none"> 1. Go to “Memory Checkout” on page 26.
System configuration does not match the installed devices.	<ol style="list-style-type: none"> 1. Go to “Checking the Installed Devices List” on page 46.
System hangs intermittently.	<ol style="list-style-type: none"> 1. Go to “Intermittent Problems” on page 42.

Peripheral Device Related Symptoms

Symptom/Error	FRU/Action
External display does not work correctly.	1. See “External Display Self-Test” in the “Common Devices Checkout” section.
Printer problems.	1. Run Printer Self-test. 2. System Board 3. Parallel Port Device 4. Cable
Serial or parallel port device problems.	1. Device 2. Device Cable 3. System Board

Other Symptoms

Symptom/Error	FRU/Action
PCMCIA slot pin is damaged.	1. System Board

Note: If you cannot find a symptom or error in this list and the problem remains, see “Undetermined Problems.”

Intermittent Problems

Intermittent system hang problems can be caused by a variety of reasons that have nothing to do with a hardware defect such as: cosmic radiation, electrostatic discharge, or software errors. FRUs replacement should only be considered when a recurring problems exists.

When analyzing the intermittent problem, do the following:

1. Run the advanced diagnostic test for the system board in loop mode at least 10 times.
2. If no error is detected, do **not** replace any FRUs.
3. If any error is detected, replace the FRU shown by the FRU code. Rerun the test to verify that no more errors exist.

Undetermined Problems

You are here because the diagnostic tests did not identify which adapter or device failed, installed devices are incorrect, a short circuit is suspected, or the system is inoperative. Follow the procedures below to isolate the failing FRU (do not isolate non-defective FRUs).

Verify that all attached devices are supported by the computer.

Verify that the power supply being used at the time of the failure is operating correctly. (See “Power Systems Checkout” on page 29.)

1. Power-off the computer.

2. Check the cables, wires, and connectors for short circuits and open circuits. Visually check them for damage. If any problems are found, replace the FRU.
3. Remove or disconnect all of the following devices.
 - a. Non-IBM devices
 - b. Devices attached to the expansion bus connector
 - c. Printer, mouse, and other external devices
 - d. Battery pack
 - e. IC DRAM card
 - f. PC cards

Note: Remember that removing the hard disk drive, an IC DRAM card, or any adapter or device, might cause configuration errors. Ignore error code 174.
4. Power-on the computer.
5. Determine if the problem has changed.
6. If the problem does not occur again, reconnect the removed devices one at a time until you find the failing FRU.
7. If the problem remains, replace the following FRUs one at a time. Do not replace a non-defective FRU.
 - Modem card (if installed)
 - LCD assembly
 - System board

Related Service Procedures

This section provides information about the following:

- "Status Indicators" on page 44
- "How to Run the Diagnostics" on page 45
- "Error Log" on page 45
- "Reset Pushbutton" on page 46
- "Checking the Installed Devices List" on page 46
- "How to Run the Low Level Format" on page 46
- "PC Test Card LED" on page 46
- "Fn Key Combinations" on page 47
- "How To Run the Keyboard Diagnostics" on page 47

Status Indicators

The system status indicators show the current computer status in different colors (green, yellow, and orange).

Symbol	Color	Meaning
	Green	Battery is fully charged.
	Yellow (340)	Battery usable. Battery is charging (when the AC Adapter is used). Note: When the battery is fully charged, the indicator turns and stays green.
	Orange	Battery is low
	Blinking orange	Battery is almost depleted
	Blinking yellow (340)	Battery cannot be charged because of its high temperature. Note: When the temperature drops to the acceptable range, charging will start.
	Off (340CSE)	The battery is not installed.
	Orange	Diskette drive is in-use
	Orange	Hard disk drive in-use
	Green	Keyboard is in Num Lock mode
	Green	Keyboard is in Caps Lock mode
	Green	Keyboard is in Scroll Lock mode

Symbol	Color	Meaning
	Green	Computer is powered on

How to Run the Diagnostics

Use either the TrackPoint II or III or the cursor move keys to interact with the tests. The Enter key works the same as selecting the OK icon to reply OK.

1. Press and hold the F1 key; then power-on the computer. Hold the F1 key down until the Easy-setup screen appears.
2. Select **Test** and press Enter.
3. Select a device and press Enter to run the test.
4. The test progress screen appears.
5. **OK** appears when the test ends without any errors.
6. Start the **Advanced Diagnostic test** by pressing **Ctrl+A** on the basic diagnostic menu screen.
7. Select **Tool** to install the tools.
8. Select a device, press the **space** key, and install the tool. Multiple devices can be selected by repeating this step.
A √ mark appears for the selected device.
9. Select **OK** and press Enter if the selection is OK.
10. Select a device and press Enter to start the tests.
11. Select **Test All** to test all devices.
12. Select **Loop Test** to loop tests.

A loop option menu appears in which a device loop or all loop can be selected. Select a device and press the **space** key to select a device. Repeat this step to select multiple devices. Press Enter to start the diagnostic loop. If no device is selected, all device tests are looped.

13. To exit the loop, keep pressing **Ctrl+Pause** until the test exits.

Error Log

Diagnostic errors are printed on the printer that is attached to the parallel port when the error is detected. The error is also logged in the system memory.

Do the following to display the errors.

1. End the test, if it is running.
2. Press **Ctrl+A** to select the advanced diagnostic mode.
3. Press **Ctrl+E**.
4. The error log appears.
5. To exit the screen, select the cancel icon or press Esc.

The error log is not saved when system power is powered-off.

Reset Pushbutton

The reset pushbutton resets the system and forces the power to be powered-off .

Note: Use this pushbutton when the power is not completely off or the system is hung. See "System Board" on page 61 for the location of the pushbutton.

Checking the Installed Devices List

If a device is installed but the icon appears in a gray shade rather than a dark shade on the basic diagnostics screen, the device is defective. Reseat the device connectors. If the symptom remains, replace the device or the system board. If needed, adjust the contrast control to clearly distinguish the shades of the icon.

If a device that is not installed appears in a dark shade, do the following.

1. Replace the **first** device, such as a FDD, HDD, or PCMCIA.
2. If the problem remains, replace the system board.

PCMCIA, Parallel, and Serial icons are always displayed in dark shade, because the icons represent subsystems of the system board and not attachment of the devices.

How to Run the Low Level Format

Do the following to format the hard disk.

Before Formatting the Hard Disk

Make sure that the address of the drive to be formatted is correct. This procedure will erase all information on the disk.

1. Power-off the computer.
2. Insert the **ThinkPad 750Ce hardware maintenance diskette** into diskette drive **A** and power-on the computer.

Note: You can use this maintenance diskette for the Model 340CSE.

3. Select **Format the hard disk** from the main menu.
4. Select the drive from the menu.
5. Follow the instructions on the screen.

PC Test Card LED

The green LED on the PC test card turns on when the PCMCIA test is running. If the LED does not turn on, check that the card is installed correctly by reseating it. If the LED still does not turn on after the card is reseated, try using another slot for the test. If the LED still does not turn on and the test fails, replace the FRU shown in the diagnostic error code.

Fn Key Combinations

The following table shows the **Fn** key and function key combinations and their corresponding functions.

The Fn key works independently from the operating system. The operating system obtains the status through the system management interface to control the system.

Fn +	Description
F1	Reserved
F2	Fuel-gauge display ON/OFF
F3	Standby mode invocation
F4	Suspend mode invocation
F5	Audio volume Down
F6	Audio volume UP
F7	LCD/CRT display switching
F8	LCD normal/reverse switching
F9	Reserved
F10	Reserved
F11	Power management mode switching (Toggles High power, Medium, Low)
F12	Reserved

How To Run the Keyboard Diagnostics

Do the following to run the keyboard test.

1. Go to the advanced diagnostic screen menu by pressing **Ctrl+A** in the Easy-Setup menu.
2. Go to the keyboard diagnostic test menu by pressing **Ctrl+K**.
3. Check that when each key is pressed, the key position on the keyboard layout on the screen changes to a black square.

Note: When a Fn key is pressed, the black square briefly appears.

Product Overview

The following table shows an overview of the system features.

Feature	Description
Processor	<ul style="list-style-type: none">• 340<ul style="list-style-type: none">– IBM486 SLC2 25/50MHz, on the system board• 340CSE<ul style="list-style-type: none">– IBM486 SLC2 25/50MHz, on the system board– IBM486 SLC2 33/66MHz, on the system board
Memory (Standard)	4MB (on the system board)
Memory (Option)	2MB, 4MB, 8MB, IC DRAM card (12MB is maximum)
CMOS RAM	128 Bytes
VGA Video	<ul style="list-style-type: none">• 340<ul style="list-style-type: none">– 9.4-inch, 64 gray, level DSTN LCD monochrome• 340CSE<ul style="list-style-type: none">– 9.4-inch, 256 color, DSTN LCD color– 10.4-inch, 256 color, DSTN LCD color
Diskette Drive	<ul style="list-style-type: none">• 0.720MB, 1.44MB (2-mode), 3.5-inch (for U.S. and European countries)• 0.720MB, 1.2MB, 1.44MB (3-mode), 3.5-inch (for Japan)
Hard Disk Drive	<ul style="list-style-type: none">• 340<ul style="list-style-type: none">– 125MB, 2.5-inch• 340CSE<ul style="list-style-type: none">– 200MB, 2.5-inch– 360MB, 2.5-inch
PCMCIA	One Type-III or Type-II

FRU Removals and Replacements

This section contains information about removals and replacements.

- **An electrostatic discharge (ESD) strap must be used to establish personal grounding.** The system board is sensitive to, and can be damaged by, electrostatic discharge. Establish personal grounding by touching a ground point with one hand before touching these units.
- Do not damage any part. Only certificated and trained personnel should service the computer.
- The arrows in the “Removals and Replacements” section show the direction of movement to remove a FRU, or to turn a screw to release the FRU. The step number with the arrow shows the correct sequence of removal. The circled numbers are sub-steps of the main step.
- When other FRUs must be removed before removing the failing FRU, they are listed at the top of the page.
- To replace a FRU, reverse the removal procedure and follow any notes that pertain to replacement. See “Locations” for internal cable connections and arrangement information.
- When replacing a FRU, use the correct screw size as shown in the table of each section.

Safety Notice 8: Translation on page 13

Before removing any FRU, power-off the computer, unplug all power cords from electrical outlets, remove the battery pack, and then disconnect any interconnecting cables.

Safety Notice 3: Translation on page 9

The battery pack contains Cadmium. Do not disassemble it, throw it into fire or water, or short-circuit it. Dispose of the battery pack as required by local ordinances or regulations.

Safety Notice 1: Translation on page 7

Before the computer is powered-on after FRU replacement, make sure all screws, springs, or other small parts, are in place and are not left loose inside the computer. Verify this by shaking the computer and listening for rattling sounds. Metallic parts or metal flakes can cause electrical shorts.

1010 Rear Connector Door

Remove the rear connector door by flexing it.

1020 Battery Pack

1030 Backup Battery

1040 IC DRAM Card

1050 Standby Battery

- Battery Pack (1020)
 - Step 2:** Standby Battery
 - Step 3:** IC DRAM Card
 - Step 4:** Backup Battery

Note

The IC DRAM card is sensitive to physical shock. Incorrect handling of the card can damage it.

Note: When removing the backup battery or standby battery, use the connector extractor (P/N 39G9977).

1060 Top Cover

- Battery Pack (1020)

Step	Location (Quantity)	Length
1	Base cover (3)	12 mm

Note: Make sure you use the correct screw.

1070 Indicator Card

- Battery Pack (1020)
- Top Cover (1060)

When Replacing

Be careful to not break the pins of the indicator card connector.

1080 Keyboard Unit

- Battery Pack (1020)
- Top Cover (1060)

Notes:

1. There are two keyboard latches on each side of the computer frame. Slide the keyboard as shown in step 2 to release the keyboard from those latches; then remove the keyboard. (Small arrows on the both sides of the keyboard show the locations of the latches.)
2. The keyboard has three cables; be careful not to damage the cables when you open the keyboard and to remove them.

When Replacing

- Check that the three keyboard cables are clean, and inserted straight and fully into the connectors. Slide both ends of each connector latch at the same time to make sure that each cable is correctly inserted.
- Go to "Keyboard/Auxiliary Input Device Checkout" on page 27 and test all keys before returning the computer to the customer.

1090 LCD Assembly

- Battery Pack (1020)
- Top Cover (1060)

Safety Notice 5: Translation on page 11

If the LCD breaks and the fluid from inside the LCD gets into your eyes or on your hands, immediately wash the affected areas with water for at least 15 minutes. Seek medical care if any symptoms from the fluid are present after washing.

Caring for the LCD

- When cleaning of the LCD becomes necessary, gently wipe the LCD with a dry, soft cloth. Do not use alcohol or detergent to clean the LCD.
- To avoid damage to the LCD, do not scratch or apply any force to its surface.
- Do not put anything on the surface of the LCD.
- **Do not pull the LCD cable.** The cable can be damaged if it is disconnected without releasing the latch.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	LCD cable (1)	6 mm
3	LCD hinge (4)	8 mm
Note: Make sure you use the correct screw.		

1100 Diskette Drive

1110 Hard Disk Drive

- Battery Pack (1020)
- Top Cover (1060)
- Keyboard Unit (1080)

Steps 1, 2, 3, 4: Diskette Drive

Steps 5, 6: Hard Disk Drive

When Replacing

- Before removing the hard disk drive, have the user make a backup copy of all information on the hard disk
- Never remove the hard disk drive while the system is operating or is in suspend mode.
- Do not pull the hard disk cable. The cable can be damaged if it is disconnected without releasing the latch.
- Do not drop or apply any shock or extra force to the hard disk drive or diskette drive. They are sensitive to physical shock.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	Diskette Drive (2)	8 mm
5	Hard Disk Drive (2)	6 mm

Note: Make sure you use the correct screw.

1120 System Board/Speaker

- Rear Connector Door (1010)
- Battery Pack (1020)
- Backup Battery (1030)
- IC DRAM Card (1040)
- Standby Battery (1050)
- Top Cover (1060)
- Indicator Card (1070)
- Keyboard Unit (1080)
- Diskette Drive (1100)
- Hard Disk Drive (1110)

Step 1, 2, 3, 4: System Board

Step 4, 5: Speaker

Step	Location (Quantity)	Length
1	I/O connector (6)	Hex-head screws
2	Base cover (1)	8 mm
3	Base cover (2)	12 mm
Note: Make sure you use the correct screws.

General Checkout

The diagnostic tests are intended to test *only* IBM products. Non-IBM products, prototype card, or modified options can give false errors and invalid system responses.

Warning: The drives might have been rearranged or the drive startup sequence might have been altered. Be extremely careful during write operations such as copying, saving, or formatting. Data or programs can be written over if you select an incorrect drive.

Japanese Models Only

The Japanese model of the ThinkPad 700C has an 89-key keyboard. This keyboard is identified by the additional keys at the left and right sides of the spacebar.

When testing the diskette drive in the Japanese model, the 1.2MB format (8 sectors per track and 15 sectors per track) in addition to the 720KB and 1.44MB formats are tested to ensure correct operation.

A 2.0MB capacity diskette is required when testing the 1.2MB format.

1. Power-off the computer and all external devices.
2. Check all cables and power cords for correct connection.
3. Make sure that no diskettes are in the drives.
4. Power-on all external devices.
5. Power-on the computer. If any error message appears on the screen, go to "Symptom-to-FRU Index" on page 82.

If no message appears on the screen, press **Ctrl+Alt+Delete** to continue. After the cursor moves to the upper right corner of the screen, press **Ctrl+Alt+Insert** to start the system program. If the IBM logo screen does not appear, insert the backup copy of the system partition into the diskette drive and start the system program again. Then press **Ctrl+A**, and run the system checkout. For information on how to disable the password, see "Power-On Password (700, 700C)" on page 97.

6. Refer to the following table. If you do not find your symptom listed, go to "Symptom-to-FRU Index" on page 82, then go to "Undetermined Problem" on page 93.

Symptom	Go to ...
Error Code or Message	"Symptom-to-FRU Index" on page 82
Configuration Problem	"Checking the Installed Devices List" on page 97
Power Problem	"Power Systems Checkout" on page 71
Memory Problem	"Memory Checkout" on page 70
TrackPoint II or Pointing Stick Problem	"TrackPoint II Checkout" on page 476
ThinkPad 700C, 720C Color LCD Problem	"LCD FRU Replacement Notice" on page 124
ThinkPad 700, 720 Mono Panel Problem	"700, 720 Mono LCD FRU Replacement" on page 124
High Speed Modem Noise Problem	"High-Speed Modem Noise Problems" on page 124

Note

For information about how to run diagnostics, error messages, passwords, and various other tests and service checks, go to "Related Service Procedures" on page 94.

Memory Checkout

Customer diagnostics can eliminate defective memory so no memory error message appears at power-on reset. After you replace a defective base memory card or IC DRAM card, run **Automatic configuration**. Otherwise, the new memory will not be recognized. Power-off the computer before you remove or replace any parts.

001

- Remove all IC DRAM cards from their slots (if installed).
- Power-off the computer, then power it on.
After the cursor moves to the upper right corner of the screen, press **Ctrl+Alt+Insert** to start the system program.
- Press **Ctrl+A** at the Main Menu.

DID THE ADVANCED DIAGNOSTIC MENU APPEAR?

Yes No

002

Replace the base memory card.
If the problem is not corrected, go to “Undetermined Problem” on page 93.

003

- Run the memory tests.
Use the RUN TESTS ONE TIME option.

DID THE MEMORY TESTS END WITHOUT AN ERROR?

Yes No

004

Replace the base memory card.

005

- Install the IC DRAM card into slot 1 and run **Automatic configuration**.
- Run the memory test.
Use the RUN TESTS ONE TIME option.

DID THE MEMORY TESTS END WITHOUT AN ERROR?

Yes No

006

Replace the IC DRAM card in slot 1.
If the problem is not corrected, replace the system board.

007

- Install the IC DRAM card into slot 2 and run **Automatic configuration**.
(Step 007 continues)

007 (continued)

- Run the memory test.
Use the RUN TESTS ONE TIME option.

DID THE MEMORY TESTS END WITHOUT AN ERROR?

Yes No

008

Replace the IC DRAM card in slot 2.
If the problem is not corrected, replace the system board.

009

If the problem occurs intermittently, run the memory tests multiple times to create an error log.

Power Systems Checkout

Note: One or all of the batteries can discharge if there is a short circuit in the system.

1. Replace the failing FRU if the power supply problem is caused by a short circuit.
2. Determine if one (or all) of the batteries have become discharged. Replace any discharged battery with its spare, if available.

The test procedures for each power supply are found on the following pages.

"Checking the AC Adapter" on page 72.
"Checking the Car Battery Adapter (700 only)" on page 73.
"Checking the Battery Pack" on page 74.
"Checking the Backup Battery" on page 75
"Checking the Standby Battery" on page 75.
"Checking the Quick Charger" on page 76.
"Checking the Voltage Converter (700, 700C)" on page 77.
"Checking the Voltage Converter (720, 720C)" on page 78.

Checking the AC Adapter: If the Power-On indicator does not turn-on, check the power cord of the AC adapter for correct continuity and installation.

1. If any noise can be heard from the AC adapter when it is plugged into the ac power outlet, replace the AC adapter.

If no noise can be heard from the AC adapter, go to step 3.

2. If a noise is still heard from the new AC adapter, suspect the computer. Replace the AC adapter with the original one, then go to the next step. If no noise is heard from the new AC adapter, the original AC adapter is defective.
3. Unplug the AC adapter cable from the computer and measure the output voltage at the plug of the AC adapter cable. See the following figure.

Pin	Voltage (V dc)
1	+19.0 to +21.0
2	Ground

- If the voltage is not correct, go to the next step.
4. Unplug the AC adapter cable from the ac power outlet and wait for a few minutes.
 5. Plug the AC adapter cable into the ac power outlet.
 6. Measure the output voltage of the AC adapter.
 - If the voltage is still not correct, replace the AC adapter.
 - If the voltage is correct, plug the AC adapter cable into the computer and try the failing operation again.
 - If the problem goes away, suspect the continuity or installation of the AC adapter cable.
 - If the problem is not corrected, replace the voltage converter.

Checking the Car Battery Adapter (700

only): If the output voltage from the cigarette lighter socket of the car is less than 10.5 V dc, the power-on indicator on the car battery adapter blinks and a noise can be heard continuously.

1. Unplug the car battery adapter cable from the connector, if connected.
2. Plug the car battery adapter into the cigarette lighter socket.

Note: If the adapter is already plugged in, be sure to unplug the adapter from the cigarette lighter socket, then plug it into the socket again.

3. Measure the output voltage of the car battery adapter cable. See the following figure.

Pin	Voltage (V dc)
1	+19.0 to +21.0
2	Ground

- If the voltage is correct and the power-on indicator on the car battery adapter is on all the time, the car battery is working correctly. Replace the voltage converter. If the problem is not resolved when the voltage converter is replaced, go to “Checking the Voltage Converter (700, 700C)” on page 77 or “Checking the Voltage Converter (720, 720C)” on page 78.
- If the voltage is outside the normal voltage range, do one of the following:
 - Try the above test procedures using a different car, if one is available.
 - Replace the car battery adapter if the computer works with the AC adapter but does not work with the car battery adapter.

Note: If the output voltage from the cigarette lighter socket of the car is less than 10.5 V dc, the power-on indicator on the car battery adapter blinks and a continuous noise can be heard. Have the car battery serviced.

Checking the Battery Pack

1. Carefully place the computer bottom-side up.
2. Remove the battery pack and measure the voltage between the battery terminals 1 (+) and 3 (-). See the following figure.

Pin	Voltage (V dc)
1	+10.0 to +18.0
2	Thermal Detection
3	Ground

- If the voltage is less than +10.0 V dc, the battery pack has been discharged or is defective.
 - If the voltage is more than +10.0 V dc, go to the next step.
3. Using an ohm meter, measure the resistance between battery terminals 2 (T) and 3 (-). The resistance must be 4 to 30 kilohms.
 - If the resistance is not correct, replace the battery pack.
 - If the resistance is correct, go to the next step.
 4. Install the battery pack and plug the AC adapter cable into the computer to charge the battery pack.
 - If the **battery power status** indicator is blinking (orange) and **battery charging** indicator is on, replace the battery pack. If the battery is charging normally, the battery is OK.

Checking the Backup Battery

1. Carefully place the computer bottom-side up.
2. Remove the bottom cover.
3. Disconnect the battery connector from the system board.
4. Measure the voltage of the backup battery. See the following figure.

Wire	Voltage (V dc)
Red	+2.5 to +3.7
Black	Ground

- If the voltage is correct, replace the system board.
- If the voltage is not correct, the backup battery has been discharged by a short circuit or it is defective.

Checking the Standby Battery

Note: Make sure that the battery pack is removed from the computer before the standby battery is removed.

1. Power-off the computer and unplug the AC adapter cable from the computer.
2. Remove the battery pack.
3. Remove the indicator cover.
4. Disconnect the standby battery connector from the voltage converter.
5. Plug the AC adapter cable into the computer and power-on the computer.
6. Measure the output voltage at the connector on the voltage converter. See the following figure.

Pin	Voltage (V dc)
1	+4
2	Ground

- If the voltage is less than +4 V dc, replace the voltage converter.
 - If the voltage is more than +4 V dc, go to the next step.
7. Power-off the computer and unplug the AC adapter cable from the computer.
 8. Reconnect the standby battery to the voltage converter.
 9. Plug the AC adapter cable into the computer and power-on the computer. Allow approximately 30 minutes for the standby battery to charge.
 10. Power-off the computer and unplug the AC adapter cable from the computer and remove the standby battery.
 11. Measure the voltage of the standby battery.
 - If the voltage is less than 3.5 V dc, replace the standby battery.

Checking the Quick Charger: If a humming or buzzing sound is heard from the quick charger when it is operating, replace the quick charger. If the charger is operating at a normal quiet sound level, do the following.

1. Perform steps 1 through 3 of the “Checking the Battery Pack” to ensure the battery pack is operating correctly.
2. Connect the power cord to the quick charger and the other end to the ac power outlet. Ensure that the power-on indicator is on.
 - If the power-on indicator does not turn on, check the power cord of the quick charger for correct continuity and installation.

- If the problem is not corrected, replace the quick charger or the power cord.
3. Install the battery pack into the quick charger.
 - If the charging indicator does not start blinking, replace the quick charger.

Checking the Voltage Converter (700, 700C):

Use the following procedure to isolate a problem with the ThinkPad 700, 700C voltage converter.

Note: If the problem only occurs when using the computer with a good battery pack, replace the voltage converter.

1. Power-off the computer.
2. Power-off all attached devices and disconnect them from the computer.
3. Unplug the AC adapter cable and remove the battery pack from the computer.
4. Carefully place the computer bottom-side up and remove the bottom cover.
5. Plug the AC adapter cable into the computer.
6. Power-on the computer.

Important

Be careful not to actuate the suspend switch (located between the Esc key and the LCD) during the operation. When you turn the computer upside down with the LCD opened, put something under the computer to prevent accidentally actuating the suspend switch.

7. Check the voltages of the voltage converter on the system board. See the following figure.

Signal	V dc Min.	V dc Max.
VA	+4.75	+5.25
VG	+4.75	+5.25
VB	+4.75	+5.25
VC	+3.42	+3.78
PWRGOOD	+4.00	+5.25

Note: Only VOLT is marked on the system board. Use the above figure to locate the VA, VG, VB, VC, and PWRGOOD signal names.

- If all voltages are correct, the voltage converter is operating correctly.
 - If the voltages are not correct, go to the next step.
8. Power-off the computer and unplug the AC adapter cable from the computer.
 9. Check for a short circuit between GND and VA, VG, VB, or VC.
 - If there is a short circuit, replace the following FRUs one at a time to correct the problem.
 - Voltage converter
 - System board
 - If there is no short circuit, go to the next step.
 10. Check the output voltage of the AC adapter cable (see “Checking the AC Adapter” on page 72).
 - If the output voltage is correct, go to the next step.
 11. Replace the following FRUs one at a time.
 - Voltage converter
 - System board

Checking the Voltage Converter (720,

720C): Use the following procedure to isolate a problem with the ThinkPad 720, 720C voltage converter.

1. Power-off the computer.
2. Power-off all attached devices and disconnect them from the computer.
3. Unplug the AC adapter cable, then remove the battery pack from the computer.
4. Carefully place the computer bottom-side up and remove the bottom cover.
5. Plug the AC adapter cable into the computer.

6. Open the LCD half-way, then stand the computer on its front edges so that the suspend switch is not activated.
7. Power-on the computer.
8. Check the voltages of the voltage converter on the system board. See the following figure.

Notes:

- a. Make sure the suspend switch (located to the left above the keyboard) is not activated during measurement of the voltage.
- b. Only PG is marked on the system board. Use the following figure to locate the VA, VG, VB, VA3, and VB3 signal names.

Signal	V dc Min.	V dc Max.
VA	+4.75	+5.25
VG	+4.75	+5.25
VB	+4.75	+5.25
VA3	+3.42	+3.78
VB3	+3.42	+3.78
PG	+4.00	+5.25

- If any voltage is not correct, go to step 9.
 - If all voltages are correct, the voltage converter is operating correctly. If the power problem did not reoccur, reconnect the devices removed in step 2 to isolate a device problem.
 - If all the voltages are correct and the power problem still exists, replace the following FRUs one by one.
 - System board
 - Processor card
9. Power-off the computer and unplug the AC adapter cable from the computer.
 10. Check for a short circuit between Ground and VA, VG, VB, VA3 or VB3. The following table shows which FRUs can cause a short at each signal.

- If there is a short circuit (less than 10 ohms), remove the FRUs indicated one at a time until the short circuit disappears. Replace the FRU causing the short circuit.

FRU	VA	VG	VB	VA3	VB3
Voltage converter	x	x	x	x	
Processor card			x		x
System board	x	x	x	x	x
Video card	x		x	x	x
Base memory card	x				
Keyboard control card	x		x		
Math coprocessor			x		x
Diskette drive			x		
Hard disk drive			x		
LCD	x				
Indicator assembly		x	x		

11. If there is no short circuit, replace the following FRUs one at a time.
- Voltage converter
 - System board

Power Management Features

The suspend and resume functions are unique methods used to save battery power. In suspend mode, all tasks are suspended and their present states are stored in memory to save power. Also, the system enters a *sleep* state where only a minimum amount of power is used.

When the computer returns to normal operation using the resume function, the computer restores the same states as when it entered suspend mode.

Full and Partial Suspend Modes: Suspend mode might be referred as full-suspend mode, as compared to partial-suspend mode.

The computer enters partial-suspend mode when an application software program interferes with the power management capability of the computer and prevents it from entering full-suspend mode. The following sounds indicate suspend mode has occurred:

- One beep for full-suspend mode
- Two beeps for partial-suspend mode

(No beep is heard if the *Power controller beep* parameter is set to off in the Set Advanced Features program.)

The computer enters suspend mode when:

- The LCD is closed (the switch is located on the voltage converter card).
- The specified time has elapsed from the last operation with the keyboard, mouse, hard disk drive, parallel connector, diskette drive, and AC adapter is plugged in. The time is specified by **System suspend** in the Set Advanced Features program.
- When a battery-low condition exists, the battery power indicator blinks (orange).
- The *PS2 OFF* command is set in the Set Advanced Features program.
- The operating temperature is exceeded.

The system returns to normal operation when:

- The LCD is opened.
- *PS2 ON HH:MM:SS* command was set in the Set Advanced Features program before entering suspend mode.
- A "Ring indicator" signal on the communication interface is detected.
- Either button of the pointing stick is pressed.

You can replace the battery pack during full-suspend mode. Never replace the battery pack during partial-suspend mode. If the battery pack is replaced during suspend mode with the LCD opened, close the LCD and open it again to return to normal operation.

Symptom-to-FRU Index

The Symptom-to-FRU Index lists error symptoms and possible causes. The most likely cause is listed first. Always begin with “General Checkout” on page 68. This index also can be used to help you decide which FRUs to have available when servicing a computer.

If you cannot correct the problem using this index, go to “Undetermined Problem” on page 93.

IMPORTANT:

1. If you have both an error message and an incorrect audio response, diagnose the error message first.
2. If you cannot run the advanced diagnostic tests, but did receive a POST error message, diagnose the POST error message.
3. If you did not receive an error message, look for a description of your error symptoms in this index.
4. Check all power supply voltages before you replace the system board. See “Power Systems Checkout” on page 71.
5. If an error message is not listed, there is a device installed that requires an additional diskette or service manual. Refer to the diskette or service manual for that device.

How to Read POST Error Messages

POST error messages are displayed on the screen as 3, 4, 5, or 8 digits. The error messages that can be displayed as shorter POST messages are highlighted in this Symptom-to-FRU Index.

Note: Adjust the speaker volume before you power-on the computer.

In the following error codes, an *X* can be any number.

Numeric Error Codes

Symptom/Error	FRU/Action
00010200, 00010300, 00010400, 00010700	1. System Board
00010800	1. System Board 2. Processor card
00011000	1. Go to “Memory Checkout” on page 70 before replacing any FRUs. 2. Base Memory Card 3. IC DRAM Card 4. System Board
000113XX	1. System Board 2. Processor Card

No beep with a blinking cursor.	<ol style="list-style-type: none"> 1. System Board 2. Processor Card 3. Any Option or Device
No beep with a normal display during POST.	<ol style="list-style-type: none"> 1. Speaker 2. System Board 3. Keyboard Control Card 4. Voltage Converter
No beep and the system hangs with CP XX at the right-bottom corner of the screen.	<ol style="list-style-type: none"> 1. System Board 2. Processor Card
No beep and the system hangs after displaying the memory count.	<ol style="list-style-type: none"> 1. System Board 2. Processor Card 3. Hard Disk Drive 4. Coprocessor
No boot with blank screen.	<ol style="list-style-type: none"> 1. System Board
Extra horizontal or vertical lines displayed on upper or lower half of the LCD.	<ol style="list-style-type: none"> 1. LCD 2. Video Card 3. System Board

Symptom/Error	FRU/Action
LCD screen unreadable or characters missing pels.	<ol style="list-style-type: none"> 1. See important note for “LCD FRU Replacement Notice” on page 124. 2. LCD Assembly 3. System Board
LCD too dark, unable to adjust contrast or brightness.	<ol style="list-style-type: none"> 1. LCD 2. Video Card
LCD slightly dims when changing to battery power.	<ol style="list-style-type: none"> 1. Normal operation (Dimming of LCD conserves battery power.)
LCD unreadable, illegible, or distorted.	<ol style="list-style-type: none"> 1. LCD 2. Video Card 3. System Board
LCD cannot be powered-on or off.	<ol style="list-style-type: none"> 1. Video Card 2. System Board 3. Voltage Converter
Blank screen, or extra horizontal or vertical lines displayed on upper or lower half of the LCD with no beep or one short beep.	<ol style="list-style-type: none"> 1. LCD 2. Video Card 3. System Board
System status indicator is incorrectly blinking or stays on.	<ol style="list-style-type: none"> 1. System Board 2. Related Device 3. Indicator Assembly
System status indicator stays off, but the POST ends without an error.	<ol style="list-style-type: none"> 1. System Board 2. Related Device 3. Indicator Assembly
No keys on the keyboard work. See “1080 Keyboard Unit” on page 54.	<ol style="list-style-type: none"> 1. Keyboard Control Card 2. Keyboard 3. External Keyboard or Numeric Keypad (if attached) 4. System Board
Keypad problems.	<ol style="list-style-type: none"> 1. Reseat cable 2. External Keypad 3. Keyboard Control Card 4. System Board
One or more keys do not work.	<ol style="list-style-type: none"> 1. See “1080 Keyboard Unit” on page 54 before replacing any FRUs. 2. Keyboard 3. External Keyboard or Numeric Keypad (if attached) 4. Keyboard Control Card

Symptom/Error	FRU/Action
Mouse and Pointing Stick problems.	<ol style="list-style-type: none"> 1. See “1080 Keyboard Unit” on page 54 before replacing any FRUs. 2. Disable Trackpoint and test Mouse again. The Trackpoint can interfere with the operation of some Mouse devices. 3. Mouse 4. Keyboard Control Card 5. Keyboard
Cursor floats or moves erratically.	<ol style="list-style-type: none"> 1. See “TrackPoint II Checkout” on page 476 before replacing any FRUs. 2. Mouse 3. Keyboard
External display problems.	<ol style="list-style-type: none"> 1. See “External Display Self-Test” on page 470 before replacing any FRUs. 2. External Display 3. Video Card 4. System Board
Incorrect memory size during POST.	<ol style="list-style-type: none"> 1. See “Memory Checkout” on page 70 before replacing any FRUs. 2. Base Memory Card 3. IC DRAM Card
System hang or Intermittent hang.	<ol style="list-style-type: none"> 1. See “Undetermined Problem” on page 93 before replacing any FRUs. 2. System Board 3. Hard Disk Drive 4. Replace the last device being tested 5. Voltage Converter
The system goes into suspend mode after the POST.	<ol style="list-style-type: none"> 1. System Board 2. Voltage Converter 3. Keyboard Control Card
The system does not suspend or resume.	<ol style="list-style-type: none"> 1. Check the Suspend/Resume switch operation. If broken, replace the Voltage Converter. 2. System Board 3. Voltage Converter 4. Keyboard Control Card 5. Keyboard
The computer does not power-off.	<ol style="list-style-type: none"> 1. Voltage Converter 2. System Board

Symptom/Error	FRU/Action
Real-time clock inaccurate.	<ol style="list-style-type: none"> 1. See “Checking the Backup Battery” on page 75 before replacing any FRUs. 2. Backup Battery 3. System Board
Printer problems.	<ol style="list-style-type: none"> 1. See “Printer Checkout” on page 474
Serial or serial port device problems.	<ol style="list-style-type: none"> 1. Device 2. Cable 3. Serial Adapter (if attached) 4. System Board
Parallel or parallel port device problems.	<ol style="list-style-type: none"> 1. Device/printer 2. Cable 3. Parallel Adapter (if attached) 4. System Board
Internal Data/Fax modem does not communicate with a remote modem or a facsimile machine.	<ol style="list-style-type: none"> 1. See “Fax/Modem Checkout” on page 472
PS2 command cannot power-off internal modem unless computer is powered-off.	<ol style="list-style-type: none"> 1. Create new PS2 setup program using UINSTALL command. (Reference Diskette must be 1.10 or later.)

Undetermined Problem

You are here because the diagnostic tests did not identify which adapter or device failed, the Devices List is incorrect or the system is inoperative. Follow the procedures below (do not isolate FRUs that are known to be good).

Check the power supply that was being used at the time of the failure. (See "Power Systems Checkout" on page 71.) If the power supply is operating correctly, continue with the following procedure.

1. Power-off the computer.
2. Remove or disconnect one of the following devices or adapter. (Do not isolate FRUs that are known to be good.)
 - a. Non-IBM devices
 - b. Modem, PC card, printer, mouse, or other external devices
 - c. Battery pack
 - d. Hard disk drive (removable disk drive)
 - e. IC DRAM card
 - f. Any adapter or device

Note: Replacing the hard disk drive, an IC DRAM card, or any adapter or device, might cause configuration errors.

3. Power-on the computer.
4. If the problem is not corrected, repeat steps 1 through 3 until you find the failing FRU or until all FRUs have been removed.
5. If all of the FRUs listed have been removed and the problem is not corrected, replace the following FRUs:
 - System board
 - Processor card
 - Video card

System Status Indicators

Symbol	State	Status Indicated
	On	Speaker is enabled

Symbol	State	Status Indicated
	Green	Battery pack is fully-charged.
	Yellow	Battery pack is half-charged.
	Orange	Battery pack is one-fourth charged.
	Blinking Orange	Battery pack is almost discharged (replace with fully charged spare).
	Off	<ul style="list-style-type: none"> • Battery pack is completely discharged. • Battery pack is removed from computer. • Computer is off. • Computer is using external power; car battery or AC power.
	On	Battery is charging
	Off	Battery is full
	On	PC Card is in-use
	On	Diskette drive is active
	On	Hard disk drive is active
	On	Keyboard is in Num Lock mode
	On	Keyboard is in Caps Lock mode
	On	Keyboard is in Scroll Lock mode
	On	Computer is in Suspend Mode
	Blinking	Computer is resuming normal operation

Symbol	State	Status Indicated
①	On	Computer is powered-on (blinking indicates temperature too high - system enters suspend mode until temperature returns to normal).

Check Point (CP) Codes

Codes beginning with "CP" are displayed on the LCD to indicate system status during POST. The CP codes vary with the level of microcode installed and the type of processor card installed. The CP codes are not error codes. If the system detects an error, the CP code is changed to a POST error message.

System Error Log

The computer system maintains a system error log. The BIOS nonmaskable interrupt (NMI) handler writes an entry to the error log each time the system detects an error.

Viewing the error log: To view the error log, start the system programs and select **More utilities** from the Main Menu, then select **Display system error log**. For any error that is displayed, help screens guide you through the actions to take.

Error Storage: The error log stores up to three *unique* errors (for example three parity errors at three different addresses). The multiple log counter (on the screen) displays the number of times each unique error occurred. You can page forward by pressing F8, or backward by pressing F7 to view the stored error logs. The date and time of the most recent occurrence also is displayed. If the POST finds that the error log has stored three unique errors, the POST displays a 000179XX error.

Note: If the system configuration is changed, the system clears any logged errors associated with the FRU that was changed. (For example, if the memory configuration was changed, memory errors are cleared from the error log). The conditions under which errors are cleared vary with the type of hardware and level of microcode installed.

Application: If the system diagnostics run error-free, but you still suspect a problem, look at the error log. If errors were detected, press the F1 key and follow the

instructions on the screen to help you determine which FRU might be causing the failure.

Checking the Installed Devices List

The Installed Devices List shows the adapters and devices installed in the computer.

If an adapter or a device is missing from the list, one of the following conditions might be the cause.

Warning: A customized setup configuration (other than default settings) might exist on the system you are servicing. Running Automatic Configuration can alter the settings. Note the current configuration settings (using the **View configuration**) and verify that the same settings are in place when service is complete.

- The protected partition on the hard disk or the Reference Diskette you are using does not contain the code required to support the device.
- An adapter or device is defective.
- The device missing from the list is not recognized as a device or adapter.
- The device missing from the list requires an additional diskette. (See the device service manual.)
- A power supply voltage is not correct (see "Power Systems Checkout" on page 71).

If the adapter is on the list, run the adapter diagnostic tests.

If the list contains an adapter or device that is not installed, go to "Undetermined Problem" on page 93.

Power-On Password (700, 700C)

Important

This information is not available in this HMM online format. See your IBM Servicer or IBM Authorized Dealer for this procedure.

Power-On Password (720, 720C)

Important

This information is not available in this HMM online format. See your IBM Servicer or IBM Authorized Dealer for this procedure.

Privileged-Access Password (PAP)

This is an option. If a PAP is set, the computer cannot start and you have to get the customer to unlock the PAP. If the PAP is set, then forgotten, it cannot be overridden or removed. The system board must be replaced.

Set Startup Sequence

1. Power-off the computer.
2. Insert the backup copy of the Reference Diskette into the diskette drive.
3. Power-on the computer.
4. Select **Set features** from the Main Menu.
5. Select **Set startup sequence**. If you cannot set the startup sequence, replace the system board.
6. Check the list of devices on the **Set startup sequence** screen.
7. Is the hard disk drive in the list as a startup device?
 - Yes** Exit from this screen and the Main Menu. Remove the backup copy of the Reference Diskette, and power-off the computer. Continue with step 8.
 - No** Add the hard disk drive as a startup device.
8. Is an operating system installed?
 - Yes** Go to step 10.
 - No** Install the operating system.
9. After the operating system is installed, power-off the computer.
10. Power-on the computer.

Note: After the programs have been restored, the Diskette and F1 prompts appear, unless an operating system is present.

Restore System Partition

If the above sequence does not correct the problem, do the following:

1. Power-off the computer.
2. Insert the backup copy of the Reference Diskette into the diskette drive.
3. Power-on the computer.
 - Note:** If the I99900X5 error message appears, the power-on password has been set. To disable the power-on password (see "Power-On Password (700, 700C)" on page 97) before continuing with the next step.
4. Select **Backup/Restore system programs** from the Main Menu, then select **Restore the System Partition**.
5. When the restore process completes, select **Set configuration**, then select **Run automatic configuration**.
6. Power-off the computer and remove the backup copy of the Reference Diskette from the diskette drive.
7. Power-on the computer.

Hard Disk Low Level Format

To format the hard disk and restore the system partition, do the following.

Warning: The following procedure causes permanent loss of the data on the hard disk. Make sure that a backup of all the information on the hard disk is made.

1. Power-off the computer.
2. Insert the backup copy of the Reference Diskette into the diskette drive.
3. Power-on the computer.
4. Proceed to the Main Menu. Press **Ctrl+A** to display the Advanced Diagnostic Menu.
5. Select **Format the hard disk** and follow the instructions on the screen to perform a low level format of the hard disk.
6. After the hard disk format is completed, power-off the computer.
7. Restore the system partition.
8. Reinstall the operating system.

Replacing the Hard Disk Drive

If you replace the internal hard disk drive, you must recopy all of the system programs onto the replacement hard disk drive. To recopy the programs:

1. Start the system using the customer's backup copy of the system partition.
2. Select **Backup/Restore system programs** from the Main Menu.
3. Run **Restore the system partition** to load the IML image, the system programs, and the diagnostic programs onto the hard disk drive just installed.

Notes:

- a. If there is not a backup copy of the system partition, make one before replacing the hard disk drive. (See "Making a System Partition Backup Copy" on page 101.)
- b. If the customer's backup copy of the system partition is incomplete, you cannot restore the whole system partition. If this occurs, after you have recopied the IML image, get the option diskettes and use **Copy an option diskette** to recopy the option files onto the system partition.
- c. If the IML image is loaded onto the hard disk drive, but the customer's operating system has not been loaded, the insert diskette icon will appear on the screen.

System Diskettes (Reference and Diagnostic)

If the hard disk drive is not operational, you can run the system programs from the Reference Diskette.

Note: The Reference Diskette contains the system programs and the Diagnostic Diskette contains the test programs. The Diagnostic Diskette is not self-starting. To run the Diagnostic Diskette, start the system from the Reference Diskette, select **Test the computer**, then follow the instructions on the screen.

Installing a New Version of the System

Diskettes: When you install the new system diskettes onto the hard disk, *all* existing files (including option files) in the system partition are written over. The new system diskettes provide the new system programs but they do not contain the option files; therefore, after completing the following process, you must reinstall the option files.

There are two methods to reinstall the option files.

1. From a backup copy of the current system partition. (this is the easiest way to reinstall the option files). For instructions on making a backup copy, see "Making a System Partition Backup Copy" on page 101.
2. From the original option diskettes.

Do the following for both methods.

1. Insert the new version of the Reference Diskette into the diskette drive.
2. Power-off the computer, then power it on. After the cursor moves to the upper right corner of the screen, press **Ctrl+Alt +Insert**.

Warning: This process writes over *all* existing files in the system partition. Before continuing, you *must* have either a backup copy of the current system partition or all the option diskettes so you can reinstall the option files.

3. Go to the Main Menu of the Reference Diskette and select **Backup/Restore system programs**, then select **Restore the system partition** and follow the instructions on the screen. This transfers all files, programs, and the IML image of the new diskette onto the system partition.
4. When the Main Menu appears again, remove the diskette from the diskette drive and power-off the computer, then power it on.
5. After the cursor moves to the upper right corner of the screen, press **Ctrl+Alt+Insert**.
6. If you have a backup copy of the current system partition, continue with step 7 on page 101. If you *do*

not have a backup copy of the current system partition, but you have the option diskettes, go to step 8 on page 101.

7. Select **Copy an option diskette** from the Main Menu. When the
INSERT YOUR OPTION DISKETTE
message appears, insert the backup copy of the system partition and follow the instructions on the screen. (The backup copy of the system partition is used to reinstall the option files onto the system partition.) Then go to step 9.
8. Select **Copy an option diskette** and follow the instructions on the screen. Repeat the procedure with each option diskette until all option diskettes have been reinstalled.
9. If there *is* a customized configuration installed (settings have been changed via the “Change configuration” screen), continue with step 10. If there *is not* a customized configuration installed, go to step 11.
10. Select **Set configuration** from the Main Menu. When you exit from **Set configuration** by pressing the **F3**, the customized configuration files will be restored onto the system partition as files @CMOS and @NVRAM.

Warning: Do not run **Run automatic configuration** now or you will write over the customized configuration.

11. You are finished with the updating process. Make a *new* backup copy of the system partition. (For information on making a backup copy, see “Making a System Partition Backup Copy.”)

Making a System Partition Backup Copy

Note: You might need two blank 2.0MB diskettes (or the old backup copy).

1. Power-off the computer, then power it on.
2. After the cursor moves to the upper right corner of the screen, press **Ctrl+Alt+Insert**.
3. When the Main Menu appears, select **Backup/Restore system programs**, then select **Backup the system partition**.
4. Insert a blank 2.0MB diskette into the diskette drive and follow the instructions on the screen.

Note: If you receive a message indicating that the diskette is full, and you are not prompted to insert a second diskette, this means that you will not be able to make a backup copy of the entire system partition. The user should keep the system diskettes and option diskette as a backup of these files.

5. When the copies are completed, label each diskette.

Japanese Model Diskette Drive and Diskette

The ThinkPad 700 uses a 1.44MB diskette drive. Both 1.0MB (formatted 720KB) and 2.0MB (formatted 1.44MB) capacity diskettes can be used in this drive.

The ThinkPad 700 Japanese model uses a diskette drive that supports 1.2MB format on 2.0MB capacity diskettes. When servicing a Japanese model, you must test all three formats.

Notes:

1. The ThinkPad 700C Japanese model has an 89-key keyboard. This keyboard is identified by the additional keys at the left and right sides of the spacebar.
2. A 2.0MB capacity diskette is required when testing the 1.2MB format.

173 and 11350 Error Combination

If a POST error combination of 00017300 and 11350 appears and cannot be bypassed, do the following before replacing any FRUs.

1. Power-off the computer.
2. Remove the hard disk drive from the computer.
3. Insert the Reference Diskette and power-on the computer.
4. Ignore any error messages, press **Esc**, **F8**, and **Enter**, then run Automatic Configuration.
5. Ignore the message "An error occurred while updating config" and power-off the computer.
6. Install the hard disk drive.
7. Keep the Reference Diskette in drive A and power-on the computer.
8. Ignore any error messages, press **Y**, and run Automatic Configuration.

PCMCIA Card Removal Tip

For the Model 720x, you can insert or remove the PCMCIA card during most computer operations. However, do not remove the card when the PC Card in-use light is on.

Product Overview

The following table provides a brief overview of the system features.

Feature	Description
Processor (700, 700C)	486SLC 25-MHz

Feature	Description
Processor (720, 720C)	486SLC 25/50-MHz
Bus Architecture	Micro Channel
Memory (Standard)	4MB
Memory (Maximum)	16MB, IC DRAM
CMOS RAM	8KB
Video	VGA
Diskette Drive	3.5-inch
Hard Drive	<ul style="list-style-type: none"> • 80MB, 2.5-inch • 120MB, 2.5-inch • 160MB, 2.5-inch
Audio Subsystem	Yes (Standard)
PCMCIA (720, 720C only)	One Type-III or Two Type-II

FRU Removals and Replacements

Follow the numerical sequence in the FRU removal sequence list and in the exploded view to remove or disconnect parts in the correct order. The letters in parentheses in the list indicate screw types. See the “Screw Size Chart” on page 20 to match the letters to the correct screw type and size before replacing each screw.

Safety Notice 8: Translation on page 13

Before removing any FRU, power-off the computer, unplug all power cords from electrical outlets, remove the battery pack, then disconnect any interconnecting cables.

- 1 Battery Pack**
(Press down and pull out)
- 2 LED Indicator Cover**
(Insert front first, then press rear down.)
- 3 Video Connector**
- 4 Video Power**
- 5 Hinge Covers**
(Install with bevelled edge at front.)
- 6 Two Screws (C)**
(One at each end)
- 7 Four Screws (S)**
(Two at each end)
- 8 LED Indicator Assembly**
(With connector and contact shield)
Lift LCD Assembly from computer
Place computer bottom-side up
- 9 Three Screws (S)**
(On bottom cover; two at front-right, one at rear of math coprocessor access door.)
- 10 Two Memory Bracket Screws (S)**
- 11 Five Screws (4-E, 1-V)**
(From processor card and video card)
- 12 Memory Module**
- 13 Ribbon Cable**
(At rear of diskette drive)
- 14 Diskette Drive**
(Hold the eject button pressed while installing.)
(Make sure the flexible cable gets into the holder plate opening on the IC DRAM card.)
- 15 Hard Disk Drive**
(Have the customer backup all information before replacing the drive. Never replace the hard disk drive when the system is operating or in suspend)

mode. Restore drive system information using the customer's backup copy of the system programs.)

16 Three Keyboard Frame Screws (S)

17 Two Screws (T)

18 System Board

(Restore system configuration data.)

19 Five Frame Stiffener Screws (S)

20 Frame Stiffener

21 Four Keyboard Screws (S)

22 Keyboard

23 One Screw (S) and Keyboard Control Card

24 Two Screws (R) and Voltage Converter with Suspend Resume Pin

(Set the lever on the voltage converter to the middle position before installation. Be sure the suspend pin is installed correctly before installing the voltage converter.)

FRU Service Procedures

Review these service procedures *before* replacing a FRU.

LCD FRU Replacement Notice: If missing or discolored dots appear on the LCD, carefully read the following note to determine whether or not you should replace the LCD.

The LCD for the Model 700C and 720C contains over 921 000 thin film transistors (TFTs). A small number of missing, discolored or lighted dots (on all the time) is characteristic of TFT LCD technology. Excessive pixel problems can cause viewing concerns. The LCD should be replaced if the number of missing, discolored, or lighted dots in any background is 21 or more.

Hinges on the color LCD are part of the FRU and are returned with the FRU.

700, 720 Mono LCD FRU Replacement:

Hinges are NOT part of the Model 700 or 720 mono LCD FRU (do not return them with the FRU). When replacing the Model 700 or 720 mono LCD, remove the right and left hinge bracket supports and install them on the new LCD. Return only the main FRU. The left and right hinge bracket supports are included in the Mono Panel Cover Group Kit.

High-Speed Modem Noise Problems: A small number of high speed modems might produce a noise when the system is powered-on. To solve this problem, copy PS2.EXE from the Reference Diskette to the root directory using the UINSTALL program. Then, add the following lines to the AUTOEXEC.BAT file.

```
PS2 SET MODEM OFF  
PS2 SET MODEM ON
```

If this does not solve the problem, replace the modem.

Checkout Guide

Service for U. S. and Canada

In the U. S. and Canada, the ThinkPad 701C/701CS is serviced only through EasyServe.

Use the following procedure as a guide for computer problems:

1. Ask the customer for as much detail as possible about the failing symptoms.
2. Verify the symptoms by attempting to recreate the failure either by running the diagnostics test or by repeating the same operation. (To run the diagnostics, refer to "Running the Diagnostics" on page 156.)
3. Use the following table with the verified symptom to determine which page to go to. Search the symptoms column and find the description that best matches your symptom; then, go to the page shown in the "Go to" column.

Note: Before replacing any FRU, see "FRU Removals and Replacements" on page 161.

Symptom	Go to
Power failure. (The power indicator does not go on or stay on.)	"Power Systems Checkout" on page 135.
POST does not complete. No beeps or error codes are indicated.	"No-Beep Symptoms" on page 146.
POST beeps, but no error codes are displayed.	"Beep Symptoms" on page 145.
POST detected an error and displayed numeric error codes.	"Numeric Error Codes" on page 142.
The diagnostics test detected an error and displayed a FRU code.	"FRU Codes" on page 144.
The configuration is not the same as for the installed devices.	"Checking Installed Devices" on page 157.
Other symptoms (such as LCD display problems).	"Symptom-to-FRU Index" on page 141, and then use the symptoms tables.
Symptoms cannot be recreated. (Intermittent problems.)	Use the customer-reported symptoms and also see "Intermittent Problems" on page 152.

General Checkout

The diagnostic tests are intended to test *only* IBM products. Non-IBM products, prototype cards, or modified options can give false errors and invalid system responses.

Warning:

- Only trained personnel should service the computer.
- Drives in the computer that you are servicing might have been rearranged or the drive startup sequence might have been altered. Be extremely careful during write operations such as copying, saving, or formatting. Data or programs can be destroyed if you select an incorrect drive.

Perform the following procedures to complete a general checkout:

1. Power-off the computer and all external devices.
2. Check all cables and power cords for correct connection.
3. Power-on all external devices.
4. Power-on the computer.
5. Press the **F1** key any time while the POST memory count is proceeding. The computer emits one short beep at the end of POST and the Easy-Setup screen appears. If this does not occur, go to "Symptom-to-FRU Index" on page 141.
6. Run the advanced diagnostics tests. For information on how to run the diagnostics tests, see "Running the Diagnostics" on page 156. For information on how to disable the password, see "Removing the Power-On Password" on page 156.
7. Find your symptom in the table in "Checkout Guide" on page 127, and then go to the appropriate page. Otherwise, see "Symptom-to-FRU Index" on page 141, and then go to "Undetermined Problems" on page 152.

Memory Checkout

Depending on the amount of additional memory installed by the customer, the memory size that is available for customer use appears differently. This is *not* a hardware problem. Consult the following table for the available memory on a system with a 4MB base memory when the customer installs different sizes of small outline dual inline memory module (SO-DIMM).

SO-DIMM Installed	Total Memory	Available Memory
None	4MB	3712KB
4MB	8MB	7808KB
8MB	12MB	11904KB
16MB	20MB	20096KB

The following table shows the available memory on a system with an 8MB base memory with different sizes of SO-DIMM.

SO-DIMM Installed	Total Memory	Available Memory
None	8MB	7 808KB
4MB	12MB	11 904KB
8MB	16MB	16 000KB
16MB	24MB	24 192KB

Memory errors might stop system operations or cause error codes to be displayed.

Use the following procedure to isolate memory problems:

Note: Make sure that the SO-DIMM is fully installed in the connector. A loose connection can cause an error. For more information about installing SO-DIMMs, see “FRU Removals and Replacements” on page 161.

1. Power-on the computer. Press the **F1** key any time while the POST memory count is proceeding. At the end of the memory test, the Easy-Setup screen appears.
2. Select **Test** and press **Enter**.
3. Press **Ctrl+A** to enter advanced diagnostics.
4. Select **Memory** and press **Enter** to run the memory test on base memory.
 - If an error appears below 3712KB on a system with a 4MB base memory (7808KB with an 8MB base memory), replace the bottom system board.
 - If an error appears above 3712KB on a system with 4MB base memory (7808KB with an 8MB base memory), replace the SO-DIMM.
5. If after replacing the SO-DIMM, an error above 3712KB on a system with a 4MB base memory or 7808KB with an 8MB base memory still appears, replace the bottom system board.
6. To exit from the test screen, press **Esc**.

If memory problems occur intermittently, use the loop option to repeat the test. For more information on running the loop test, see “Running the Diagnostics” on page 156. When the test detects an error, an error log is printed on the printer connected to the parallel port. See “Printing and Displaying Error Logs” on page 157 for more information.

Do not replace FRUs because of a single, nonreproducible failure. Single failures can occur for a variety of reasons that have nothing to do with a hardware defect, such as electrostatic discharge or software errors. Consider replacing a FRU only when a recurring problem exists. If you suspect that problems besides a failing FRU exist,

clear the error log and run the test again. Do not replace any FRUs if errors do not reoccur.

Updating Flash Memory: BIOS and Easy-Setup, which includes configuration programs and diagnostic tests, are stored in Flash memory. To update them, Flash memory must be updated.

When Updating Flash Memory

Do not power-off the computer, disconnect the Vac power, or remove the battery pack during the Flash update. The system board will have to be replaced if the update is interrupted.

Updating Flash memory also resets all of the customer's configuration settings to the default values.

To update the Flash memory, perform the following steps:

1. Within the Configuration Utility, check the "Startup Sequence" setting and make sure that it is set to **Smart** or **Conventional**. If it is set to **Hard Disk**, change the setting to **Smart** or **Conventional** to set the system to boot from the update diskette in the following procedure.

If you change the user's setting, make a note of the setting before changing it.

2. Power-off the computer.
3. Connect the computer to Vac power and install a charged battery pack.
4. Insert the Flash update diskette in drive A.
5. Power-on the computer.
6. Follow the instructions as they appear to update Flash memory.
7. Power-off the computer, and then power it on again. Error codes 162 and 163 will be displayed.

Press **Enter** to enter the Configuration Utility. Reset the date and time.

8. Press **Esc** to leave the Configuration Utility, and then press **Enter** to save the changes.
9. If the Flash update fails, replace the bottom system board. Save the system board that failed, marking it "to be reflashed."

Keyboard/Auxiliary Input Device Checkout

Remove the external keyboard if the internal keyboard is to be tested.

If the internal keyboard does not work or an unexpected character appears, make sure that the three flexible cables extending from the keyboard are correctly seated in the connectors on the top system board.

If the keyboard cable connection is correct, run the **Keyboard Test** by performing the following steps:

1. Power-off the computer, and then power it on again.
2. Press the **F1** key any time while the POST memory count is proceeding. At the end of the memory test, the Easy-Setup screen appears.
3. Press the left or right arrow key to select **Test** and press **Enter** or position the pointer over the **Test** icon and click the left click button once.
4. Press **Ctrl+A** to enter advanced diagnostics.
5. Press **Ctrl+K** to start the keyboard diagnostics test.
6. Press each key. A shaded box appears in the corresponding key position on the keyboard layout on the screen. Press the key again to remove the box.

Note: The shaded box appears in **Fn** only during the first keyboard test of a diagnostics session.

7. To exit from the test screen, press **Esc**.

If the tests detect a keyboard problem, perform the following tasks one at a time to correct the problem:

Note: Do not replace a nondefective FRU.

- Reseat the three cables.
- Replace the keyboard.
- Replace the top system board.

The following auxiliary input devices are supported for this computer through the MultiPort II:

- Numeric keypad
- Mouse (PS/2* compatible)
- External keyboard (standard PS/2 or with keyboard/mouse cable)

If any of the above devices do not work, reseat the cable connector and repeat the failing operation. If the problem does not reoccur, recheck the connector. If the problem reoccurs, repeat the operation with a device that is known to be good. If the problem still reoccurs, go to "MultiPort II Checkout" on page 134.

TrackPoint III Checkout

If the TrackPoint III does not work, check the configuration in the Configuration Utility by pressing **PgDn** to reach the **I/O Management** screen. If the setting for TrackPoint III is Off, press the left or right arrow to change it to On. If this does not correct the problem, continue with the following procedure:

Note: The TrackPoint III performs automatic compensations to adjust the pointer sensor. During this process, the pointer moves about the screen for a short time. This self-acting pointer movement can occur when a slight, steady pressure is applied to the TrackPoint III pointer when the computer is powered on, when the system is running, or when readjustment is required because the temperature has changed significantly within a short period of time or the temperature is higher than its operating temperature. This symptom does not indicate a hardware problem. No service actions are necessary if the pointer movement stops in a short period of time. However, the TrackPoint III will not stabilize if you apply pressure to it. If pointer movement occurs, you can go into Suspend mode, and then resume normal operation. Resuming or turning the computer on both cause the TrackPoint III to be calibrated, which may correct the problem. If you see continual movement of the pointer, the TrackPoint III is probably defective. In rare cases, the top system board can also cause this problem.

If a click-button problem or TrackPoint III problem occurs, perform the following steps:

1. Power-off the computer, and then power it on again.
2. Press the **F1** key any time while the POST memory count is proceeding. At the end of the memory test, the Easy-Setup screen appears.
3. Select an item with the TrackPoint III.
4. Press either the left or right click button.
5. Verify that both buttons work correctly.

If either the TrackPoint III or the click button does not work, perform the following tasks one at a time to correct the problem:

Note: Do not replace a nondefective FRU.

- Reseat the three keyboard cables.
- Replace the keyboard.
- Replace the top system board.

Diskette Drive Checkout

Use the following procedure to isolate the diskette problem to a controller, drive, or diskette. For this test, you need a scratch, write-enabled, double-sided, high-density diskette (2.0MB that formats to 1.44MB) that is known to be good.

1. Power-off the computer.
2. Attach the external diskette drive if it is not already attached.
3. Power-on the computer.
4. Press the **F1** key any time while the POST memory count is proceeding. When the memory test is completed, the Easy-Setup screen appears.
5. Press the left or right arrow key to select **Test** and press **Enter** or position the pointer over the **Test** icon and click the left click button once.
6. Press **Ctrl+A** to enter the advanced diagnostics.
7. Select the **FDD-1** icon and press **Enter**. This runs the controller test and the drive read/write test.
8. If the controller test detects an error, FRU code 10 appears. First, replace the diskette drive and cable and run the test again. If FRU code 10 appears from this second test, replace the top system board.
9. If the controller test runs without errors, select **Tool** from the advanced diagnostics screen. (See "Running the Diagnostics" on page 156 for instructions.) Select the **FDD-1** icon and insert a scratch diskette to continue with the drive test.
10. Select the **FDD-1** icon from the advanced diagnostics screen and press **Enter**.
11. If the drive test detects an error, FRU code 50 appears. Replace the drive or the drive cable.
12. To exit from the test screen, press **Esc**.

Hard Disk Drive Checkout

1. Power-off the computer.
2. Insert the hard disk drive to be tested.
3. Power-on the computer. Press the **F1** key any time while the POST memory count is proceeding. When the memory test is completed, the Easy-Setup screen appears.
4. Press the left or right arrow key to select **Test** and press **Enter** or position the pointer over the **Test** icon and click the left click button once.
5. Press **Ctrl+A** to enter advanced diagnostics. and press **Enter**.
6. If the test detects an error, FRU code 60 appears under the **HDD-1** icon. Replace the hard disk drive.
7. To exit from the test screen, press **Esc**.

MultiPort II Checkout

Use the following procedure to isolate a MultiPort II problem. The MultiPort II attaches to the system expansion connector at the rear of the computer.

1. Power-off the computer.
2. Remove all of the devices from the MultiPort II.
3. Unplug the AC adapter from the computer, if attached, and plug the AC adapter into the MultiPort II if it is not already attached.
4. Attach wrap plugs to the serial port and the parallel port on the MultiPort II.
5. Power-on the computer.
6. Press the **F1** key any time while the POST memory count is proceeding. When the memory test is completed, the Easy-Setup screen appears.
7. Press the left or right arrow key to select **Test** and press **Enter** or position the pointer over the **Test** icon and click the left click button once.
8. Press **Ctrl+A** to enter advanced diagnostics.
9. Select **Tool** to install the wrap plugs on the ports. (See "Running the Diagnostics" on page 156 for instructions.)
10. Run the diagnostics tests on the parallel and serial ports on the computer and the MultiPort II. To test the external display device, select the **Display** icon. Test results will be displayed under the icon for each selected device.
11. If the diagnostics tests do not find errors, suspect a problem with the previously attached devices.

If the tests find errors, perform the following steps to recheck the computer:

- Power-off the computer.
- Remove the MultiPort II from the computer.
- Power-on the computer and rerun the tests on the available parallel and serial ports.

If the errors do not reoccur, replace the MultiPort II.

If the errors persist, suspect that the errors are related to internal FRUs and replace the appropriate FRU (for information on FRU codes, see "FRU Codes" on page 144).

12. If power problems appear only when using the MultiPort II, replace the MultiPort II.
13. To exit from the test screen, press **Esc**.

Power Systems Checkout

To verify the symptom of the problem, power-on the computer using each of the power sources available as follows:

1. Remove the battery.
2. Connect the AC adapter and check that power is supplied by pressing the power switch.
3. Disconnect the AC adapter and install the charged battery; then, check that power is supplied from the battery by pressing the power switch.

Note: The battery is charged only while the computer is powered-on (the computer can be in the suspend mode). The battery cannot be charged if the computer is powered-off.

If you suspect a power problem, see the appropriate power-supply check listed below:

- “Checking the AC Adapter.”
- “Checking the Battery Pack” on page 136.
- “Checking the Standby Battery” on page 137.

Checking the AC Adapter: Check the AC adapter if the computer fails only when the AC adapter is used, or if the battery does not charge when the AC adapter is attached and the computer is on or in suspend mode.

- If the power problem occurs only when the MultiPort II is used, replace the MultiPort II.
- If the power-on indicator does not turn on, check the AC adapter for correct continuity and installation. If the connection is suspect, replace the AC adapter.
- If the operational charge does not work, go to “Power Related Symptoms” on page 149.

Note: Several types of AC adapters can be supplied with the ThinkPad 701C/701CS. The procedure for checking them is the same.

1. Unplug the AC adapter cable from the computer and measure the output voltage at the plug of the AC adapter cable. See the following figure.

Pin	Voltage (V dc)
1	+15.5 to +17.0
2	Ground

- If the voltage is not correct, replace the AC adapter.
Note: In rare cases, the problem may be in the AC adapter even when the voltage is correct. If an AC adapter is available, try replacing the computer's AC adapter.
- If the voltage is correct, replace the top system board.
If this does not correct the problem, go to "Undetermined Problems" on page 152.

Note: An audible noise from the AC adapter does not always indicate a defective adapter.

Checking the Battery Pack: Perform the following steps to check the battery:

Safety Notice 7: Translation on page 12

Though main batteries have low voltage, a shorted or grounded battery can produce enough current to burn combustible materials or personnel.

- Remove the battery.
Note: To remove the battery, end external communications if you are not using an AC adapter. Power-off the computer, and then close the lid. Unlock the battery compartment door located on the bottom of the computer. Slide the battery out of the compartment.
- Measure the voltage between battery terminals 1 (+) and 4 (-). See the following figure.

Terminal	Voltage (V dc) / Signal
1	11.0 (nominal) (Range +10.0 to +16.0)
2	VCC
3	I/O
4	Ground

Note: The signal lines not used in these steps, terminals 2 and 3, are used for communication between the system and the battery.

3. If the voltage is less than +10.0 V dc, the battery has been discharged or is defective. Recharge the battery.

If the voltage is still less than +10.0 V dc after the recharging, replace the battery.

Checking the Standby Battery: Before performing the following steps, make sure that the standby battery is fully charged by leaving the computer plugged into ac power while on or in suspend mode for 24 hours. The computer can be used normally while the standby battery is charging. If any problem is not corrected after charging the standby battery, perform the following steps.

1. Power-off the computer and unplug the AC adapter from the computer.
2. Remove the battery.
3. Remove the top system board.
4. Replace the standby battery from the bottom of the top system board.
5. Reinstall the top system board.
6. Plug the computer into ac power, power-on the computer, and let the standby battery charge for 24 hours.
7. To verify standby battery operation, remove and reinstall the battery while the computer is in the suspend mode.

Note: For this test to be valid, the battery should be reinstalled within 1 minute.

The resume operation should start.

8. If the resume operation does not work, replace the top system board.

Infrared Transceiver Checkout

The infrared transceiver is located on the inverter card in the ThinkPad 701C/701CS. When you run diagnostics on the infrared transceiver, the test is actually checking the top system board, not the infrared transceiver itself. Therefore, complete the following steps before running diagnostics or replacing any FRUs.

If the customer cannot establish a connection between the ThinkPad 701C/701CS and a remote system, perform the following steps:

1. Ensure that the device the customer attempted to connect with is an Infrared Data Association (IRDA) compliant device.
2. Check to make sure that both systems are using the same revision level of the same software.
3. Check setup options on both systems to ensure that the baud rate and other setup parameters are the same.
4. Check the Configuration Utility to ensure that the infrared transceiver is assigned to the same serial port that is designated in the application software and that the IRQ assignment is not shared with any other device such as the internal modem or external serial port on the MultiPort II.
5. Verify that the two systems are in close proximity (less than 1 meter [3.2 feet] apart for IRDA-compliant devices) and that the infrared transceiver window on the ThinkPad 701C/701CS is aligned with (directly opposite) the remote device's window.
6. Ensure that the windows on both systems are clean and unobstructed.

If the two systems still will not connect after you have followed the preceding steps and the remote system is another computer with a terminal program (for example, Windows** Terminal** or Procomm**) installed, perform the following tests:

1. Set up the terminal application on each system to communicate with the infrared transceiver serial port at a speed of 115KB per second.
2. Type characters on the ThinkPad 701C/701CS keyboard and check to see whether or not these characters appear on the remote system. (Note that the characters you type will not appear on the ThinkPad 701C/701CS system.)
3. Type characters on the remote keyboard and check to see whether or not these characters appear on the ThinkPad 701C/701CS system.
4. If characters do not appear in either step 2 or 3 and you are certain that infrared is working correctly on the remote system, replace the inverter card.
5. If characters do appear, consult the software vendor to ensure that the customer is using a compatible software package and that the setup parameters are correct.

If data transfers between the ThinkPad 701C/701CS and the remote system are slow or unstable:

1. Verify that the two systems are in close proximity (less than 1 meter [3.2 feet] apart for IRDA-compliant devices) and that the infrared window on the ThinkPad 701C/701CS is aligned with the remote device's window.
2. Ensure that the windows on both systems are clean and unobstructed.
3. If you are using TranXit, check the IRDELAY parameter in the TRANXIT.INI file in the TRANXIT directory. The parameter should be set to 10.

To run the diagnostics test on the infrared transceiver, perform the following steps:

1. Power-off the computer, and then power it on again.
2. Press the **F1** key any time while the POST memory count is proceeding. When the memory test is completed, the Easy-Setup screen appears.
3. Press the left or right arrow key to select **Test** and press **Enter** or position the pointer over the **Test** icon and click the left click button once.
4. Press **Ctrl+A** to enter advanced diagnostics.
5. Select **Infrared** and press **Enter** to run the test on the infrared transceiver. Test results will be displayed under the **Infrared** icon.
6. If no errors are detected, the "OK" message appears.
7. If an error is detected, the FRU code and error description message appear. Go to "FRU Codes" on page 144 and replace the FRU.
8. To exit from the test screen, press **Esc**.

PCMCIA Checkout

For a more thorough test, use one PCMCIA card in each slot. Perform the following steps to test the PCMCIA** slots:

1. Power-off the computer, and then power it on again.
2. Press the **F1** key any time while the POST memory count is proceeding. When the memory test is completed, the Easy-Setup screen appears.
3. Press the left or right arrow key to select **Test** and press **Enter** or position the pointer over the **Test** icon and click the left click button once.
4. Press **Ctrl+A** to enter advanced diagnostics.
5. If you are using PC test cards, select **Tool** to install them. Insert the cards when prompted. (For instructions on installing test cards, see "Running the Diagnostics" on page 156. For instructions on inserting the cards, see "Removing PCMCIA Cards" on page 159.)

6. Select the **PCMCIA** icon and press **Enter** to run the test on the PCMCIA slots. The green LED on the PCMCIA card should turn on when the test runs. (If the green LED does not turn on, see “Reading the PC Test Card LED” on page 158.) Test results will be displayed under the **PCMCIA** icon.
7. If no errors are detected, the “OK” message appears.
8. If an error is detected, the FRU code and error description message appear. Go to “FRU Codes” on page 144 and replace the FRU.
9. To exit from the test screen, press **Esc**.

Symptom-to-FRU Index

The Symptom-to-FRU Index contains tables that list causes of symptoms. The most likely cause is listed first. Use this index to help you decide which FRUs to have available when servicing a computer.

Safety Notice 8: Translation on page 13

Before removing any FRU, power-off the computer, unplug all power cords from electrical outlets, remove the battery pack, then disconnect any interconnecting cables.

Perform the FRU replacement or actions in the sequence shown in the "FRU / Action" columns. If the replacement FRU did not solve the problem, put the original FRU back in the computer.

Notes:

1. Before replacing the top and bottom system boards, try reseating the boards. If reseating the boards does not correct the problem, replace the boards.
2. If possible, install the latest level of BIOS available before replacing any FRU.

Before completely reassembling a computer that has been repaired, try to reboot the computer to check the repairs that have been completed. However, when you reboot without the keyboard attached, the computer will display error codes 8603, 8613, and 86XX.

Use displayed numeric error codes to determine the system problem. If numeric error codes are not available, use the other symptom tables that describe specific symptoms. If the symptom is not listed, go to "Undetermined Problems" on page 152.

Note:

For IBM devices not supported by diagnostics codes of ThinkPad 701C/701CS, see the manual for those devices.

Numeric Error Codes

Numeric error codes show the errors detected in POST or system operation. Use the error codes displayed on the screen to diagnose failures. If more than one error code is displayed, begin the diagnosis with the first error code. The cause of the first error code can result in false error codes being displayed.

In the following error codes, **X** can be any number.

Symptom/Error	FRU/Action
02X, 101, 107	<ol style="list-style-type: none"> Battery. AC Adapter Memory Option. Top System Board.
10X	<ol style="list-style-type: none"> Bottom System Board.
119	<ol style="list-style-type: none"> Top System Board.
161, 163	<ol style="list-style-type: none"> Set Configuration. (Press Fn+F1 to enter the Configuration Utility and set the time and date.) Top System Board. Bottom System Board.
162 (Check the Installed Devices list for a missing device.)	<ol style="list-style-type: none"> Set Configuration. (Press Fn+F1 to enter the Configuration Utility and set your configuration.) Any Missing Device. Top System Board. Bottom System Board.
164 (Memory size error)	<ol style="list-style-type: none"> If a SO-DIMM card has been removed, press Fn+F1 to enter the Configuration Utility, and verify the memory size. Replace the installed SO-DIMM. Bottom System Board.
184	<ol style="list-style-type: none"> Press Fn+F1 to enter the Configuration Utility, and then reset the Power-on Password.
195 (The hibernate partition does not match memory size.)	<ol style="list-style-type: none"> Check if the disk drive is from another computer or if the memory size has changed. Go to “Hard Disk Drive Checkout” on page 133. Hard Disk Drive

Symptom/Error	FRU/Action
196 (Read error occurred in the hibernate area of the Hard Disk Drive.)	<ol style="list-style-type: none"> 1. Disable, and then enable Hibernate mode. 2. Go to "Hard Disk Drive Checkout" on page 133. 3. Hard Disk Drive
197 (The computer memory size is not equal to the hibernate area size on the Hard Disk Drive.)	<ol style="list-style-type: none"> 1. Disable, and then enable Hibernate mode.
1XX (Not listed above.)	<ol style="list-style-type: none"> 1. Top System Board. 2. Bottom System Board.
2XX	<ol style="list-style-type: none"> 1. Go to "Memory Checkout" on page 128. 2. SO-DIMM 3. Bottom System Board
3XX (Before replacing FRUs, power-off, and then power-on the computer.)	<ol style="list-style-type: none"> 1. Remove attached external devices. 2. Reseat cables. 3. Keyboard 4. Top System Board
6XX	<ol style="list-style-type: none"> 1. Go to "Diskette Drive Checkout" on page 133. 2. Diskette 3. Diskette Drive Cable 4. Diskette Drive 5. Top System Board
09XX, 10XX	<ol style="list-style-type: none"> 1. Top System Board.
11XX	<ol style="list-style-type: none"> 1. Modem 2. Top System Board 3. Bottom System Board
17XX	<ol style="list-style-type: none"> 1. Go to "Hard Disk Drive Checkout" on page 133. 2. Hard Disk Drive 3. Bottom System Board
24XX (For external displays, see the "External Display Self-Test" in the Common Devices Checkout section before replacing any FRUs.)	<ol style="list-style-type: none"> 1. External Display. 2. External Display Power Cord. 3. Backlight Lamp Assembly. 4. LCD Assembly. 5. Bottom System Board. 6. Inverter Card.
8000	<ol style="list-style-type: none"> 1. Set Configuration. 2. PCMCIA Card. 3. Bottom System Board.

Symptom/Error	FRU/Action
860X (Pointing device error when TrackPoint III is disabled.)	<ol style="list-style-type: none"> External Mouse. External Keyboard. Top System Board. Bottom System Board.
861X (Pointing device error when TrackPoint III is enabled.)	<ol style="list-style-type: none"> Reseat the TrackPoint III cable (the narrowest keyboard cable) at the Top System Board. External Mouse. Keyboard. Top System Board. Bottom System Board.
86XX (Not listed above)	<ol style="list-style-type: none"> Pointing Device. TrackPoint III. Keyboard. Numeric Keypad. Top System Board. Bottom System Board.
12902	<ol style="list-style-type: none"> Bottom System Board.
I9990305	<ol style="list-style-type: none"> Go to “Hard Disk Drive Checkout” on page 133. Hard Disk Drive Bottom System Board
Other codes not listed above	<ol style="list-style-type: none"> Go to “Undetermined Problems” on page 152.

FRU Codes

If an error is detected by the diagnostics tests, a *four-digit* FRU code is displayed, along with an error code. The FRU code indicates two suspected FRUs. Replace the FRU that is indicated by the *two leftmost digits* first, and then replace the FRU indicated by the *two rightmost digits*. No FRU is assigned to code 00. If only one FRU is suspected, the other FRU code is filled with zeros. See the referenced page before replacing the FRU.

FRU Code	FRU/Action
10	<ol style="list-style-type: none"> Diskette Drive Bottom System Board Top System Board
12	Top System Board
14	Bottom System Board
20	Memory (See “Memory Checkout” on page 128.)
32	External Keyboard
33	External Mouse

FRU Code	FRU/Action
40	LCD Assembly (See "Disassembling the LCD Assembly" on page 172.)
45	External CRT
50	<ol style="list-style-type: none"> 1. Reseat the Diskette Drive (FDD-1). 2. Diskette Drive (FDD-1)
51	<ol style="list-style-type: none"> 1. Reseat the Diskette Drive (FDD-2). 2. Diskette Drive (FDD-2)
55	<ol style="list-style-type: none"> 1. Insert a correctly formatted 2.0MB diskette into the Diskette Drive.
60	<ol style="list-style-type: none"> 1. Reseat the Hard Disk Drive (HDD-1). 2. Hard Disk Drive (HDD-1)
61	<ol style="list-style-type: none"> 1. Reseat the Hard Disk Drive (HDD-2) on the docking station. 2. Hard Disk Drive (HDD-2)
70	External PCMCIA
81	Internal Modem Card
91	If MultiPort II is installed: <ol style="list-style-type: none"> 1. Reseat MultiPort II. 2. MultiPort II. If Dock II is installed: <ol style="list-style-type: none"> 1. Reseat Dock II. 2. Dock II

Note: The device ID and error codes are used to indicate in detail the portion of the FRU that caused the error. If replacing a FRU does not correct a problem, see the device ID or error code from the previous failure. If they have changed, the new FRU might be defective or incorrectly installed.

If the problem remains after replacement of the FRUs, go to "Undetermined Problems" on page 152.

Beep Symptoms

Symptom/Error	FRU/Action
Continuous beeps.	<ol style="list-style-type: none"> 1. Top System Board
One beep and a blank, unreadable, or flashing LCD.	<ol style="list-style-type: none"> 1. Reseat all LCD connectors. 2. LCD Assembly 3. Bottom System Board
One beep, and the message "Unable to access boot source."	<ol style="list-style-type: none"> 1. Boot device 2. System Board
One long, two short beeps, and a blank or unreadable LCD.	<ol style="list-style-type: none"> 1. Bottom System Board. 2. LCD Assembly

Symptom/Error	FRU/Action
One long beep followed by four short beeps each time the power switch is operated. (System cannot power-on due to low battery voltage.)	1. Connect the AC adapter or install a fully charged battery.
One beep every second. (System is entering Suspend mode due to low battery voltage.)	1. Connect the AC adapter or install a fully charged battery (allows system to suspend operation before changing the battery).
Two short beeps with error codes.	1. POST error. See “Numeric Error Codes” on page 142.
Two short beeps with blank screen.	1. Top System Board. 2. Bottom System Board.

No-Beep Symptoms

Symptom/Error	FRU/Action
No beep, power-on indicator not on, and a blank LCD during POST.	1. Go to “Power Systems Checkout” on page 135. 2. Top System Board. 3. Power sources.
No beep, power-on indicator on, and a blank LCD during POST.	1. Top System Board. 2. Bottom System Board.
No beep, power-on indicator on, and a blinking cursor only during POST.	1. Top System Board. 2. Bottom System Board.
No beep during POST but system runs correctly.	1. Turn the volume up. 2. Speaker. 3. Top System Board.

LCD-Related (Video) Symptoms

Note that LCD-related symptoms might be a result of software problems. Therefore, before working on hardware to correct video problems, make sure that the system has the latest versions of the video drivers installed. Systems that do not have the latest versions of video drivers might experience symptoms such as random extra pixels.

Note: To check the versions of the video drivers, follow these steps:

- In DOS.

Drivers display their version level when they are loaded. To check them after they have been loaded, look in CONFIG.SYS or AUTOEXEC.BAT files for video driver information.

- In Windows.

Drivers installed using the video driver installation utility place an icon in the **Control Panel**, in the **Main** group. Double-click on the **ChipsCPL** icon to display the driver dialog box. Choose the **Version** button to display the driver level.

Symptom/Error	FRU/Action
No beep, power-on indicator on, and a blank LCD during POST.	<ol style="list-style-type: none"> 1. Adjust contrast. 2. Top System Board. 3. Bottom System Board.
<ul style="list-style-type: none"> • LCD backlight not working, or • LCD too dark, or • LCD brightness cannot be adjusted. 	<ol style="list-style-type: none"> 1. Reseat LCD connectors. 2. Reseat inverter card. 3. Inverter Card. 4. LCD Assembly.
LCD contrast cannot be adjusted (ThinkPad 701CS only).	<ol style="list-style-type: none"> 1. Reseat LCD connectors. 2. Top System Board. 3. LCD Assembly.
<ul style="list-style-type: none"> • LCD screen unreadable, or • Characters missing pels, or • Screen abnormal, or • Wrong color displayed. 	<p>[See important note for “Disassembling the LCD Assembly” on page 172.]</p> <ol style="list-style-type: none"> 1. Check that the latest versions of the drivers are installed. 2. Reseat LCD connectors. 3. Bottom System Board. 4. LCD Assembly.
LCD has extra horizontal or vertical lines displayed.	<ol style="list-style-type: none"> 1. LCD Assembly.
Blank LCD, system runs correctly during POST.	<ol style="list-style-type: none"> 1. Check display type. (Press Fn+F1 to enter the Configuration Utility, and then reset Display type to LCD.)

Keyboard and TrackPoint III Symptoms

Symptom/Error	FRU/Action
Keyboard (one or more keys) does not work.	<ol style="list-style-type: none"> 1. Reseat the two larger keyboard cables. 2. Keyboard. 3. Top System Board.
TrackPoint III does not work or the pointer moves automatically ("drifts") or does not work correctly.	<ol style="list-style-type: none"> 1. Go to "TrackPoint III Checkout" on page 132.

MultiPort II Related Symptoms

Before testing or replacing the MultiPort II, ensure that the customer installed the MultiPort II while the computer was powered-off or in Suspend mode. Make sure the problems occur when the MultiPort II has been installed correctly.

Symptom/Error	FRU/Action
Devices connected to the MultiPort II do not work correctly.	<ol style="list-style-type: none"> 1. Check the device connectors to make sure that they are connected correctly. 2. Check the cables to make sure they are not defective or damaged. 3. Go to "MultiPort II Checkout" on page 134.
Problems occur when the MultiPort II is connected or removed (unlatched).	<ol style="list-style-type: none"> 1. Verify that the MultiPort II is correctly seated and that the latches are engaged properly. 2. Go to "MultiPort II Checkout" on page 134.
Power problems occur when the MultiPort II is connected to the computer.	<ol style="list-style-type: none"> 1. Remove and then reattach the AC adapter to the computer or the MultiPort II. 2. MultiPort II. 3. Top System Board.

Indicator Related Symptoms

Symptom/Error	FRU/Action
Indicator incorrectly remains on or off, but system runs correctly.	<ol style="list-style-type: none"> 1. Reseat the inverter card. 2. Inverter Card. 3. Top System Board.
Battery status indicator blinks green and beeps three times at power-on or Resume.	<ol style="list-style-type: none"> 1. Check that a fully charged battery is installed. 2. Battery Pack 3. Reseat Top and Bottom System Boards together. 4. Top System Board. 5. Bottom System Board.
Battery status indicator blinks green at power-on.	<ol style="list-style-type: none"> 1. Check the card-to-card connection. Reseat Top and Bottom System Boards together. 2. Top System Board. 3. Bottom System Board.
Battery status indicator does not turn on when battery fuel gauge is over 90% but less than 100%.	<ol style="list-style-type: none"> 1. This is normal operation if charging continues. Leave the computer charging, and then recheck the battery fuel gauge a short time later to see whether the charge has increased.

Power Related Symptoms

Symptom/Error	FRU/Action
Power shut down during operation.	<ol style="list-style-type: none"> 1. Go to "Power Systems Checkout" on page 135. 2. Battery Pack 3. Power sources 4. Top System Board
The system will not power-off.	<ol style="list-style-type: none"> 1. If you are in Suspend mode, resume by pressing Fn. Then, try to power-off. 2. Disconnect the computer from ac power. 3. Remove the battery. 4. If problem occurs consistently, replace the Top System Board.

Symptom/Error	FRU/Action
Battery pack charges, but the battery status indicator does not light.	<ol style="list-style-type: none"> 1. Reseat the Inverter Card. 2. Replace the Inverter Card.
Battery pack does not charge, the battery status indicator does not light, and the battery fuel gauge is less than 90%.	<ol style="list-style-type: none"> 1. Check the AC adapter connection. Make sure that the computer is powered-on or in Suspend mode. 2. Check the Configuration Utility to ensure that the AC adapter is supplying the correct voltage level. 3. Check the AC adapter. 4. Make sure that the computer is within the operational temperature range. 5. Change the AC adapter. 6. Replace the Battery Pack. 7. Replace the Top System Board.

Function Related Symptoms

Symptom/Error	FRU/Action
The system will not enter Suspend mode or resume by opening or closing the LCD.	<ol style="list-style-type: none"> 1. Check the Configuration Utility to ensure that the Suspend on Lid Close function is enabled. 2. Check that the computer can enter Suspend mode by pressing Fn+F4. 3. Top System Board. 4. Bottom System Board.
Memory count (size) appears different from actual size.	<ol style="list-style-type: none"> 1. Go to “Memory Checkout” on page 128.
System configuration does not match the installed devices.	<ol style="list-style-type: none"> 1. Go to “Checking Installed Devices” on page 157.
System stops intermittently.	<ol style="list-style-type: none"> 1. Go to “Intermittent Problems” on page 152.

Infrared Related Symptoms

See “Infrared Transceiver Checkout” on page 137 for information on the infrared transceiver and infrared transceiver checkout.

Audio Related Symptoms

Symptom/Error	FRU/Action
You cannot hear any sound.	<ol style="list-style-type: none">1. In the Configuration Utility, check the volume level and the settings for Audio Power and Mute.2. Attach external speakers or headphones and check for sound:<ul style="list-style-type: none">• If the external speakers or headphones work, replace the internal speaker.• If the external speakers or headphones do not work, replace the Top System Board.
Internal microphone does not record.	<ol style="list-style-type: none">1. Check the application’s recording source and level.2. Attach an external microphone and check for recording:<ul style="list-style-type: none">• If the external microphone works, replace the internal microphone.• If the external microphone does not work, replace the Top System Board.
Other audio problems.	<ol style="list-style-type: none">1. Replace the Top System Board.

Peripheral Device Related Symptoms

Before testing or replacing any peripheral device, go into the Configuration Utility and ensure that all of the configurations are correct. Also, check applications to ensure that devices are configured correctly.

Symptom/Error	FRU/Action
External display does not work correctly.	<ol style="list-style-type: none">1. See “External Display Self-Test” in “Common Devices Checkout” section.
Printer problems.	<ol style="list-style-type: none">1. Run Printer self-test.2. Cable.3. Parallel Port Device.4. Top System Board.
Serial or parallel port device problems.	<ol style="list-style-type: none">1. Device.2. Device Cable.3. Top System Board.

Other Symptoms

Symptom/Error	FRU/Action
Errors occur only when MultiPort II is used	1. See "MultiPort II Checkout" on page 134.
PCMCIA slot pin is damaged.	1. Bottom System Board.

Note: If you cannot find a symptom or error in this list and the problem remains, see "Undetermined Problems."

Intermittent Problems

Intermittent system interruptions can be caused by a variety of reasons that have nothing to do with a hardware defect, such as electrostatic discharge or software errors. Consider replacing a FRU only when a recurring problem exists.

When analyzing the intermittent problem, perform the following steps:

1. Run the advanced diagnostics test in loop mode at least 10 times.
2. If no error is detected, do **not** replace any FRUs.
3. If any error is detected, replace the FRU shown by the FRU code. Rerun the test to verify that no more errors exist.

Undetermined Problems

Perform the following procedures to isolate the failing FRU if the diagnostics tests did not identify which adapter or device failed, or whether the installed devices are incorrect, a short circuit is suspected, or the system is inoperative.

Note: Do not replace a nondefective FRU.

Before performing these procedures, perform the following actions:

- Verify that all attached devices are supported by the computer.
 - Verify that the power supply being used at the time of the failure is operating correctly. (See "Power Systems Checkout" on page 135.)
1. Power-off the computer.
 2. Check the cables, wires, and connectors for short circuits and open circuits. Visually check them for damage. If any problems are found, replace the FRU.

3. Remove or disconnect all of the following devices:
 - a. Non-IBM devices
 - b. Devices attached to the expansion bus connector
 - c. Printer, mouse, and other external devices
 - d. Battery pack
 - e. Hard disk drive
 - f. Diskette drive or the device attached to the diskette drive connector
 - g. SO-DIMM card
 - h. PCMCIA cards

Note: Remember that removing the hard disk drive, a SO-DIMM card, or any adapter or device will cause configuration errors. Error code 162 will occur.

4. Power-on the computer.
5. Determine whether the problem has changed.
6. If the problem does not occur again, reconnect the removed devices one at a time until you find the failing FRU.
7. If the problem remains, replace the following FRUs one at a time.

Note: Do not replace a nondefective FRU.

- Inverter Card.
- LCD Assembly.
- Top System Board.
- Bottom System Board.

Related Service Procedures

Understanding Fn Key Combinations

The following table shows the **Fn** key and function key combinations and their corresponding functions.

The **Fn** key works independently from the operating system. The operating system obtains the status through the system management interface to control the system.

Fn+	Description
(alone)	Resumes operation from Suspend mode.
F1	Enters the Configuration Utility.
F2	Turns the battery-gauge icon on and off.
F3	Enters Standby mode.
F4	Enters Suspend mode.
F5	Mutes and unmutes speaker.
F6	Turns the hard disk off.
F7	Cycles through display options (LCD, CRT, both).
F8	Reverses video display.
F9	Reserved.
F10	Reserved.
F11	Reserved.
F12	Enters Hibernate mode.
Insert	Increases contrast. (This combination key does not provide this function on ThinkPad 701C as TFT screens do not require contrast adjustment.)
Delete	Decreases contrast. (This combination key does not provide this function on ThinkPad 701C as TFT screens do not require contrast adjustment.)
Home	Increases brightness.
End	Decreases brightness.
PgUp	Increases speaker volume, unmutes speaker.
PgDn	Decreases speaker volume.

Reading Status Indicators

The system status indicators show the current computer status in different colors (green and yellow).

Symbol	Color	Meaning
	Green	Battery charging.
	Blinking green	Battery low.
	Yellow	Hard disk drive in use.
	Green	Keys in NumLk mode.
	Green	Keys in Caps Lock mode.
	Green	Keys in ScrLk mode.
	Green	Computer powered on and not in Suspend mode.

Reading the Battery Status: If the computer is using the battery, the **Battery Status** field in the Configuration Utility indicates whether the battery is OK or low. If the computer is using external power, this field indicates whether the battery is fully charged or still charging. The battery fuel gauge provides a visual indication of the battery power level.

Understanding the Power-On Self-Test

Each time you power-on the computer, the power-on self-test (POST) is initiated. The POST takes up to 90 seconds to complete, depending on the options installed.

The POST checks the following items: system boards, memory, display, keyboard, diskette drive, hard disk drive, parallel port, and serial port.

To start the POST, power-on the computer. The following actions will happen:

1. If a critical error occurs during the POST, the system halts. The system might beep or display a message. If the POST cannot be completed successfully, an error code appears on the display, and you are prompted to press **Esc** or **Enter**. If you press **Esc**, the computer bypasses the error and attempts to complete the POST. If you press **Enter**, the computer displays the Configuration Utility window. You can then try to correct the error. (See "Running the Diagnostics" on page 156.)
2. The computer issues one short beep when the POST ends successfully.

3. The computer attempts to load the operating system as customized. If the computer does not find an operating system, it displays a graphic message requesting that you insert a bootable diskette in the diskette drive and press **F1** to resume operation.

Removing the Power-On Password

Important

This information is not available in this HMM online format. See your IBM Servicer or IBM Authorized Dealer for this procedure.

Running the Diagnostics

Use either the TrackPoint III or the cursor movement keys to interact with the tests. When asked for an "OK" response, press **Enter** or select the **OK** button.

1. With the computer powered-off, attach any test tools to the device to be tested. For example, attach a wrap plug to the serial port on the MultiPort II or insert the PC test cards in the PCMCIA slot.
2. Power-on the computer. Press the **F1** key any time while the POST memory count is proceeding. When the memory test is completed, the Easy-Setup screen appears.
3. Select **Test** and press **Enter**.
4. Press **Ctrl+A** to enter advanced diagnostics.
5. Select **Tool** to install a test tool.

Select the test tool for a device, and press the spacebar or click button to install it. A \checkmark mark appears for the selected device. Repeat this step to install multiple devices.

Note: A graphic message prompts you to attach the selected test tools.

6. Select **OK** and press **Enter** if the selection is correct.
7. Select a device and press **Enter** to start the tests.
8. Select **Test All** to test all devices.
9. Select **Looptest** to loop tests.
A loop option menu appears in which you can select a loop test for one or more devices. Select a device and press the spacebar or click key. A \checkmark mark appears for the selected device. Repeat this step to select multiple devices. Press **Enter** to start the diagnostics loop. If no device is selected, all device tests are looped.
10. To exit the loop, keep pressing **Ctrl+Pause** until the test exits. The system emits a beep sound to notify you that the test program has received the exit interrupt.
11. Press **Esc** to exit the test screen.
12. Choose **Restart** to leave Easy-Setup and restart your system.

13. Select **OK** or press **Enter** to confirm the restart.

Printing and Displaying Error Logs

Diagnostics errors are printed on the printer that is attached to the parallel port when the error is detected. The error is also logged in the system memory.

Use the following procedure to display the errors:

1. End the test, if it is running.
2. Press **Ctrl+A** to enter the advanced diagnostics.
3. Press **Ctrl+E**.
4. The error log appears.
5. To exit the screen, select **Cancel** or press **Esc**.

The error log is not saved when system power is turned off.

Checking Installed Devices

Installed devices are displayed as dark icons on the diagnostics screen. All other devices are displayed with gray icons.

If a device is installed but the icon appears gray rather than dark, the device is defective. Reseat the device connectors, and then restart diagnostics. If the symptom remains, replace the device or the system board. If needed, adjust the contrast control to clearly distinguish the shades of the icon.

If a device that is not installed appears in a dark shade, for example, if HDD-2 appears in a dark shade when a second hard disk drive is not installed, perform the following steps:

1. Replace the *first* device, such as HDD-1.
2. If the problem persists, replace the relevant system board.

The PCMCIA, System Board, Display, and infrared transceiver icons are always displayed in a dark shade, because the icons represent subsystems of the system board and not attached devices. The parallel port icon is dark except when the diskette drive is attached to the parallel port; in that case, the FDD icon is dark and the parallel port icon is gray. Icons for devices attached through the MultiPort II are dark when the devices are attached, and are gray when the devices are removed from the MultiPort II.

The HDD-1 icon represents the *first* drive in the system configuration. Similarly, the HDD-2 icon represents the *second* drive, attached to the docking station.

Running the Low-Level Format

Perform the following steps to format the hard disk:

Warning: All data and formatting on the disk will be destroyed and cannot be recovered. Have the user make a backup copy of all information on the hard disk that should be saved. Make sure that a bootable diskette is available. Make sure that the drive address to be formatted is correct.

Use either the TrackPoint III or the cursor movement keys to interact with the tests. When asked for an "OK" response, press **Enter** or select the **OK** button.

1. Power-off the computer, and then power it on again.
2. Press the **F1** key any time while the POST memory count is proceeding. When the memory test is completed, the Easy-Setup screen appears.
3. Select **Test** and press **Enter**.
4. Press **Ctrl+A** to enter advanced diagnostics.
5. Press **Ctrl+F**. The **Format** icon appears at the top of the advanced diagnostics screen.
6. Select the **Format** icon and press **Enter**.
7. Select the hard disk to be formatted and press **Enter**.
8. A confirmation screen appears, showing the number of cylinders, heads, and sectors on the hard disk.
9. Press **Esc** to exit the low-level format screen without formatting the hard disk.
10. Press **Enter** to begin the low-level format of the hard disk. When the low-level format is completed, the advanced diagnostics screen is displayed.
11. When you restart the computer, a graphic message is displayed at the end of POST, requesting that you insert a bootable diskette into the diskette drive and press **F1** to resume operation.

Reading the PC Test Card LED

The green LED on a PC test card (JEIDA/PCMCIA wrap card) turns on when the PCMCIA test is running. If the LED does not turn on, check that the card is installed correctly by reseating the card. If it still does not turn on after the card is reseated and you are using one PC test card, try using the other slot for the test. If you are using two cards, try swapping the cards in the slots. If the LED still does not turn on and the test fails, replace the FRU shown in the diagnostics error code.

Removing PCMCIA Cards

After removing the PCMCIA cover, and filler plug if it is installed, you can insert or remove PCMCIA cards during most computer operations.

To insert a PCMCIA card, perform the following steps:

1. Insert the PCMCIA card into one of the available slots, with the long row of pin sockets facing the computer and the label on the PCMCIA card facing up. When the card is in place, the blue eject button at the left of the slot pops out. Do not force the card. If the card does not fit into the slot, turn it over.

Note: A Type III PCMCIA card occupies both PCMCIA slots. To insert the card, aim its bottom ridges at the lower PCMCIA card slot.

2. Replace the outer cover over the PCMCIA slots.

To remove a PCMCIA card, perform the following steps:

1. Use a small pointed object such as the point of a pen to press the blue eject button located to the left of the PCMCIA card slot.

Note: A Type III PCMCIA card occupies both PCMCIA slots. To remove the card, press the bottom eject button.

2. Carefully slide the PCMCIA card out of the slot.
3. If both PCMCIA slots are empty, replace the filler plug and replace the outer cover over the PCMCIA slots.

Note: Do not remove PCMCIA cards while the system is in Suspend or Hibernate mode. If you remove a PCMCIA card while the system is in either mode, you might lose configuration information. Or, if you remove a PCMCIA card and insert another card, your system might not recognize the new card.

Product Overview

The following table provides a brief overview of the system features.

Feature	Description
Processor	Intel** 486** DX2 25/50MHz or DX4 25/75MHz, with math coprocessor.
Memory (Standard)	4MB or 8MB (on the system board).
Memory (Optional)	4, 8, or 16MB SO-DIMM.
Bus Architecture (Two Busses)	<ul style="list-style-type: none">• Local bus for hard drive and video (with hardware line draw, BITBLT, cursor, and sprite support).• ISA bus

Feature	Description
CMOS RAM	128 Bytes.
VGA Video	<ul style="list-style-type: none"> <li data-bbox="301 312 718 394">• ThinkPad 701CS 10.4-inch, 640 × 480, 256/226K color, DS-STN LCD color. <li data-bbox="301 396 718 478">• ThinkPad 701C 10.4-inch, 640 × 480, 256/226K color, TFT LCD color.
Diskette Drive	1.44MB (3-mode for Japan, 2-mode for other countries) 3.5-inch external.
Hard Drive (Removable)	<ul style="list-style-type: none"> <li data-bbox="301 564 501 588">• 360MB, 2.5-inch <li data-bbox="301 590 501 615">• 540MB, 2.5-inch <li data-bbox="301 617 601 641">• 720MB, 2.5-inch (optional)
Audio	<ul style="list-style-type: none"> <li data-bbox="301 656 493 680">• Built-in speaker <li data-bbox="301 682 536 707">• Built-in microphone. <li data-bbox="301 709 508 733">• Microphone jack. <li data-bbox="301 735 591 760">• Speaker/headphone jack. <li data-bbox="301 762 459 786">• Line-in jack. <li data-bbox="301 788 664 850">• Supports SoundBlaster** and SoundBlaster Pro** applications.
Internal Modem Card	Data/Fax/Voice Modem with 14.4 Kbps transmission rate and telephony support (U.S. and Canada only).
PCMCIA Cards	<p data-bbox="288 956 576 981">Accepts any of the following:</p> <ul style="list-style-type: none"> <li data-bbox="301 991 526 1015">• One or two Type I. <li data-bbox="301 1017 532 1042">• One or two Type II. <li data-bbox="301 1044 622 1069">• One Type I and one Type II. <li data-bbox="301 1071 470 1095">• One Type III.
Infrared Transceiver	Integrated infrared hardware IRDA-compatible transceiver with 115.2 Kbps transmission rate.

FRU Removals and Replacements

This section contains information about removals and replacements.

Follow the numerical sequence in “Disassembling the ThinkPad 701C/701CS” on page 163 and the three exploded views to remove or disconnect parts in the correct order. Reverse the numerical sequence to replace FRUs. Note exceptions and special instructions for replacement throughout the FRU removal procedure.

The letters in parentheses in the list indicate screw types. Consult the following screw size chart to match the letters to the correct screw type and size before replacing each screw.

BA	Nut, M2.5	Silver
		
BC	M2.5, 6 mm	Black
		
BD	M2.5, 8.4 mm	Black
		
BE	M2.5, 10 mm	Black
		
BF	M1, 3 mm	Black
		
BG	M2.5, 7.5 mm	Black
		
BH	M2.5, 8 mm	Black
		
BI	M2.5, 5 mm	Black
		
BJ	M2, 8 mm	Silver
		

BK	M2.5, 16 mm	Black
		
BL	M2.5, 6 mm	Black
		
<p>Note:</p> <ol style="list-style-type: none"> 1. Use a TORX** T1 screwdriver on the BF screw. Torque to 0.5 in./lb. 2. For the other listed screws, use a TORX T6 screwdriver. Torque to 2.5 in./lb. 		

Safety Notice 8: Translation on page 13

Before removing any FRU, power-off the computer, unplug all power cords from electrical outlets, remove the battery pack, then disconnect any interconnecting cables.

Safety Notice 1: Translation on page 7

Before the computer is powered-on after FRU replacement, make sure all screws, springs, or other small parts are in place and are not left loose inside the computer. Verify this by shaking the computer and listening for rattling sounds. Metallic parts or metal flakes can cause electrical shorts.

Note: Before removing any FRU, remove any attached devices, including the diskette drive, diskette drive cable, and MultiPort II if they are attached.

Safety Notice 2: Translation on page 8

Some standby batteries contain a small amount of nickel and cadmium. Do not disassemble it, recharge it, throw it into fire or water, or short-circuit it. Dispose of the battery as required by local ordinances or regulations. Use only the battery in the appropriate parts listing when replacing the RTC or backup battery. Use of an incorrect battery can result in ignition or explosion of the battery.

Disassembling the ThinkPad 701C/701CS

This procedure provides the steps required to completely disassemble the ThinkPad 701C/701CS.

The three exploded views show the parts of the computer that are removed at various stages of the disassembly process. The numbered callouts in the figures correspond to steps in the procedure.

ThinkPad 701C/701CS Exploded View

ThinkPad 701C/701CS Exploded View

ThinkPad 701C/701CS Exploded View

If you follow all of the steps in this procedure, you completely disassemble the ThinkPad 701C/701CS.

However, for some replacement operations, you may not need to completely disassemble the ThinkPad 701C/701CS. In those situations, the relative sequence of steps in this procedure is important. Some FRUs must be removed to reach the failing FRU, or to make it easier to work with another FRU.

This procedure contains instructions for the following:

- Removing the Keyboard Cover
- Removing the Keyboard
- Separating the Display and Base Units
- Removing the Top System Board and Inverter Card
- Removing the Bottom System Board and Modem
- Taking Apart the Base Assembly

1 Remove the battery shown in the figure on page 163.

2 Remove the SO-DIMM cover and any installed SO-DIMM cards, shown in the figure on page 163.

See “Removing and Replacing the SO-DIMM Card” on page 178 for more detailed information.

3 Remove the PCMCIA cover and filler plug shown in the figure on page 164. Remove any installed PCMCIA cards.

See “Removing PCMCIA Cards” on page 159 for more detailed information.

4 Remove the parallel port cover, shown in the figure on page 163.

Warning: Do not drop or apply any shock to the hard disk drive. The hard disk drive is sensitive to physical shock. Incorrect handling can damage it and cause permanent loss of data on the hard disk. Before removing the hard disk drive, have the user make a backup copy of all the information on the hard disk. Never remove the hard disk drive while the system is operating or while it is in Suspend mode.

5 Remove the hard disk drive, shown in the figure on page 163.

Note: Remove the hard disk drive by inserting a coin in the slot and twisting until the hard disk drive is unseated. Do not apply any extra force to the hard disk drive when removing it.

Removing the Keyboard Cover

6 Remove the screw (BC) located on the right side toward the back of the computer, shown in the figure on page 163.

7 Remove the screw (BK) located on the rear bottom left of the computer shown in the figure on page 163.

8 Open the computer lid all the way (180°) and remove the keyboard shelf, shown in the figure on page 164.

To release the keyboard shelf from the base assembly:

1. Gently pull up on the right side of the keyboard shelf.
2. Insert a tool into the slots on the back of the computer and gently push in to release the tabs holding in the shelf.

Removing the Keyboard

9 Remove the four screws (BF) located on the front, below the keyboard, shown in the figures on pages 163 and 164.

10 Remove the five remaining screws from the bottom of the base.

(For the screw types that are removed in this step, see the figure on page 163.)

Replacement:

Warning: When you reinstall the screws, be careful when tightening the middle screw toward the rear of the computer. If you tighten the screw too much, you can break the plastic base. If you are using an electric screwdriver, set it to a low or sensitive setting to prevent breakage.

11 Remove the screw (BC) located below the right hinge.

Replacement: When you replace the screws in the base and the keyboard shelf, perform the steps in the following order:

1. Replace the screw (BC) in step **11** shown in the figure on page 164. Do not tighten the screw until the front keyboard screws are in place.
2. Replace the keyboard shelf.
3. Replace the front keyboard screws in step **9** shown in the figure on page 163.
4. Tighten the BC screw.
5. Replace the screws in step **10**.

12 Remove the keyboard, shown in the figure on page 164.

To remove the keyboard, push it backward slightly, and then pull it up, then forward and out.

Replacement: When you reinstall the keyboard, follow these steps:

Warning: When you reinstall the keyboard, be careful not to damage the keyboard cables by pinching or crushing them.

1. Attach the three flat cables.
2. Tilt the front of the keyboard up and push the rear of the keyboard toward the back of the computer.
3. Press the keyboard down.
4. Pull the keyboard slightly forward to engage the latches located at the back right, and in the middle of the left and right sides.

Warning: Do not pull out the cable before releasing the sliding latch connector.

13 Detach the three keyboard cables from the top system board shown in the figure on page 164.

The keyboard cables use zero insertion force (ZIF) connectors.

Instructions for working with ZIF connectors:

To detach the cables, pull out the small sliding latch under each cable using a small tool to pull on each side. Try to pull the latch out incrementally on each side, or pull out both sides simultaneously.

Replacement: When you reinstall cables in ZIF connectors, insert the cable connector end, metal side facing up, into the connector, and then gently push in each sliding latch to secure the cable. Do not twist the cables.

Warning: Do not pull out the cable before releasing the sliding latch connector.

Separating the Display and Base Units

14 Detach the LCD cable shown in the figure on page 164.

Slide up the ferrite core on the cable to reach the latches.

The LCD cable uses ZIF connectors.

Replacement: For information about reconnecting the LCD cable, see “Replacing the LCD Assembly” on page 175.

15 Remove the ferrite core from the LCD cable shown in the figure on page 164.

Replacement: For information about replacing the ferrite core, see “Replacing the LCD Assembly” on page 175.

16 Detach the microphone cable from the top system board, shown in the figure on page 164.

Replacement: Make sure that the two aluminum spacers are in place. After you reattach the microphone cable, place any excess cable behind the PCMCIA slot assembly. For information on

routing the backlight cable, see “Routing the Backlight Cable” on page 176.

- 17 Detach the LCD backlight cable from the inverter card, shown in the figure on page 164.**

Replacement: For information on routing the backlight cable, see “Routing the Backlight Cable” on page 176.

- 18 Detach the speaker cable from the top system board, shown in the figure on page 164.**

Replacement: After you reattach the speaker cable, place any excess cable behind the PCMCIA slot assembly.

- 19 Remove the four hinge screws (BG) shown in the figure on page 164.**

Close the computer lid before removing the screws.

- 20 Remove the LCD assembly, shown in the figure on page 164.**

Replacement: See “Disassembling the LCD Assembly” on page 172 for instructions on FRU removals and replacements for the LCD assembly. See “Replacing the LCD Assembly” on page 175 for instructions on replacing the LCD assembly.

Removing Top System Board and Inverter Card

- 21 Remove the top system board and the attached standby battery and inverter card, shown in the figure on page 164.** Reuse the rubber spacers.

Separate the metal spacers between the top and bottom system boards. Gently pull up the front of the top system board and insert a tool at the slot located near the battery connector. Press down with the tool and gently pry up to detach the top system board from the bottom system board.

Replacement: See “Replacing the Top System Board” on page 178 for information about replacing the top system board.

Safety Notice 3: Translation on page 9

The battery pack contains small amounts of nickel. Do not disassemble it, throw it into fire or water, or short-circuit it. Dispose of the battery pack as required by local ordinances or regulations. Use only the battery in the appropriate parts listing when replacing the battery pack. Use of an incorrect battery can result in ignition or explosion of the battery.

- 22 Remove the standby battery, shown in the figure on page 164.**

Replacement: When you replace the standby

battery, fold the cable and place the standby battery in the space beside the battery pack connector.

Safety Notice 6: Translation on page 12

To avoid shock, do not remove the plastic cover that surrounds the lower portion of the inverter card.

23 Remove the inverter card from the top system board, shown in the figure on page 164.

24 Remove the infrared window from the inverter card, shown in the figure on page 164.

Removing Bottom System Board and Modem

25 Remove the screw (BL) holding in the bottom system board, shown in the figure on page 165.

26 Remove the two screws (BC) located on the docking connector shown in the figure on page 165.

Replacement: When you replace these screws, use the following order:

1. Install one docking connector screw.
2. Install the bottom system board screw (from step **25**).
3. Install the other docking connector screw.

Safety Notice 4: Translation on page 10

The backup battery is a lithium battery and can cause a fire, explosion or severe burn. Do not recharge it, remove its polarized connector, disassemble it, heat it above 100 degrees C (212 degrees F), incinerate it, or expose its cell contents to water. Dispose of the battery as required by local ordinances or regulations. Use of an incorrect battery can result in ignition or explosion of the battery. Replacement batteries can be ordered from IBM or IBM Authorized Dealers.

27 Remove the bottom system board and the attached modem shown in the figure on page 165.

To remove the bottom system board, push in lightly on the modem connector to free it from the base. Make sure that the modem connector has been freed from its slot in the base before removing the bottom system board.

Replacement: When you replace the bottom system board, keep the speaker cable toward the rear of the computer. Do not leave it folded under the bottom system board. Reuse the rubber spacers.

28 Remove the two bolts (BJ) and nuts (BA) holding the PCMCIA slot assembly to the bottom system board, shown in the figure on page 165.

29 Remove the PCMCIA slot assembly, shown in the figure on page 165.

30 Remove the modem shown in the figure on page 165.

The modem is held in place with an adhesive gasket. You may need to pry gently on the modem to remove it from the bottom system board. When you reinstall the modem, you may need to apply a new adhesive gasket.

Taking Apart the Base Assembly

31 Remove the power switch cover, shown in the figure on page 165.

Warning: The speaker can magnetize metal and corrupt a diskette.

Warning: A scratch can damage the speaker. Be careful not to damage it with screwdrivers, screws, or other objects.

32 Remove the speaker, shown in the figure on page 165.

After you have removed the speaker, carefully remove any metal particles that might have flaked off.

33 Remove the adhesive gasket shown in the figure on page 165.

Replacement: Follow these steps in order:

1. Remove the old adhesive gasket and apply a new one to the base.
2. With the front of the base facing you, rotate the speaker so that the speaker wires are at "one o'clock," then attach the speaker to the gasket.
3. Position the speaker cable under the bottom system board and between the inverter card and the top system board to the connector on the top system board.

34 Remove the screen over the speaker, shown in the figure on page 165.

If the screen over the speaker is damaged, replace it.

Disassembling the LCD Assembly

Safety Notice 5: Translation on page 11

If the LCD breaks and the fluid from inside the LCD gets into your eyes or on your hands, immediately wash the affected areas with water for at least 15 minutes. Seek medical care if any symptoms from the fluid are present after washing.

- 1** Remove the two bottom screws (BH).
- 2** Remove the left hinge cover (cam).
- 3** Remove the four bezel screws (BD).

- 4 Carefully unsnap the T-shaped snaps along the bottom edge of the bezel, and lift it out.

Be sure to use the correct replacement bezel for the LCD.

The TFT bezel has adhesive on its top side wall. When you install a new TFT bezel, remove the backing first.

- 5 Remove the microphone.
- 6 Remove the backlight cable protective sleeve.

Replacement:

For detailed information about replacing the microphone and sleeve, see “Replacing the Microphone and Sleeve” on page 174.

- 7 Remove the LCD.

When you replace the LCD, be sure to replace it with the correct type of LCD (STN or TFT).

- 8 Remove the LCD cable from the LCD.

- 9 Remove the latches from the bezel.

- 10 Remove the latch springs from the latches.

Replacement:

When replacing the latches, place the latch in the bezel, and then slide the spring over the post on the latch. Compress the spring slightly and slip it into the recess in the bezel.

- 11 Remove the two right hinge screws (BI).

- 12 Remove the right hinge.

The left hinge is part of the top cover assembly, and should be replaced with it as a unit.

Note: To clean the LCD, use rubbing alcohol and a soft cloth.

To avoid damaging the LCD, do not scratch or apply any force to its surface.

Important

The LCD for the ThinkPad 701C contains over 921 000 thin film transistors (TFTs). A small number of missing, discolored, or lighted dots (on all the time) is characteristic of TFT LCD technology, but excessive pixel problems can cause viewing concerns. The LCD should be replaced if the number of missing or discolored, or lighted dots in any background is 21 or more.

Replacing the Microphone and Sleeve

The right hinge should already be installed. To replace the microphone and cables, perform the following steps:

1. Insert the microphone wires into the small slit in the backlight cable protective sleeve.
2. Holding the microphone and sleeve near the hinge, insert the yellow backlight cable through the slit in the sleeve, and then the brown cable. Do not allow the microphone cable to twist around the backlight cables.
3. Slip the sleeve into place so that the flange is inside the computer lid, toward the LCD.
4. Insert the microphone into the space between the hinge and the LCD, with the foam block against the right side of the space. Press the block gently to ensure that it is completely inserted.

Make sure that the foam does not cover the microphone diaphragm. When installed correctly, the microphone lines up with the two small slots in the bezel.

Replacing the LCD Assembly

To reattach the LCD assembly, follow these steps:

1. With the LCD cable flat, carefully wrap the end of the LCD cable around the attached sleeve on the cable, finishing with the end of the cable coming from behind the sleeve.
2. To prevent possible damage, tape the end of the cable to the bezel while you reattach the LCD assembly.
3. Place the LCD assembly on the base in the closed position. Make sure that the backlight and microphone cables are *inside* the base unit.
4. Replace the four hinge screws (BG).
5. Open the computer lid all the way (180°) and remove the tape from the LCD cable.
6. Slide the ferrite core over the end of the LCD cable, pushing the core onto the cable just far enough to expose the two sets of silver contacts on the cable.
7. Connect the LCD cable to the connectors on the bottom system board by inserting the flat ends of the cable. Then, push in the small sliding latch under each cable to secure the cable in the connector. Do not bend or fold the LCD cable. Press on the loop of cable around the sleeve to insert the cable ends into the connectors.
8. Pull the ferrite core forward on the cable until the core touches the connectors and it can be pressed down flat on top of the bottom system board.

Routing the Backlight Cable

- 1** Brown wire.
- 2** Yellow wire.

Warning: Incorrect routing of the backlight cable may cause it to break after repeated opening and closing of the computer lid. Routing the cable correctly is important to prevent this breakage.

To route the backlight cable, follow these steps:

1. Plug the LCD backlight cable into the inverter card. Do not twist the wires.
2. Position the brown wire behind the connector so that after it exits the connector housing, it goes down between the inverter card and back wall of the base cover. (It must be outside of the inverter insulator.)
3. Loop the brown wire toward the LEDs and over the top of the connector.

Backlight cable routing from the rear, shown without the computer lid.

- 1** Brown wire.
- 2** Yellow wire.

4. Route the yellow wire in the same manner as the brown wire. Position the yellow wire beside the brown wire where it runs over the connector on the side toward the back of the computer. Do not allow the wires to cross.
5. Be careful to keep the cable in the correct position as you complete the assembly of the computer.

Replacing the Top System Board

Perform the following steps when you replace the top system board:

1. Before inserting the top system board, move the power switch cover forward toward the front of the base assembly. Make sure that the spring in the power switch is fully inside the plastic housing.
2. Insert the top system board, tilting the board to the left and aligning the appropriate connectors with the slots on the base assembly. Be careful to align the power switch cover with the switch mechanism on the board.
3. Gently press the battery pack connector down to place the connector in the slot on the base assembly.
4. Ensure that the inverter card is firmly attached to the top system board, and that the infrared window is attached to the inverter card. The infrared window has a top and bottom. Install the window with the long side with the partial cutout facing the top of the inverter card.
5. Feed the speaker cable between the inverter card and the top system board to the right of the inverter card connector to the board.
6. As you press lightly down on the top system board and the inverter card, slip the bottom corners of the inverter card into the slots in the base assembly.
7. Gently but firmly press on the middle of the top system board to finish inserting the board and to ensure a complete connection between the board-to-board connectors.

Removing and Replacing the SO-DIMM Card

Warning: The SO-DIMM card is sensitive to physical shock. Incorrect handling of the card can damage it.

To remove a SO-DIMM card, follow these steps:

1. Power-off the computer.
2. Remove the battery.
3. Disconnect all cables and other devices, including the AC adapter.
4. Close the computer and turn it upside down.
5. Open the SO-DIMM door.

6. Press the metal tabs on each side of the SO-DIMM away from the card. The card should raise slightly as the tabs are pulled away from it.
7. Remove the card by holding it at a 15 to 20 degree angle and pulling it firmly away from the SO-DIMM socket.
8. Replace the SO-DIMM door.
9. Reattach all cables and other devices, including the AC adapter.
10. Power-on the computer. The computer will display error code 164.

To insert a SO-DIMM card, follow these steps:

1. Power-off the computer.
2. Remove the battery.
3. Disconnect all cables and other devices, including the AC adapter.
4. Close the computer and turn it upside down.
5. Remove the SO-DIMM door.
6. Locate the notch on the SO-DIMM.

Warning: Do not insert the SO-DIMM too far. You might damage the SO-DIMM or SO-DIMM socket.

7. Position the card at a 15 to 20 degree angle to the SO-DIMM socket with the notch facing to the right when you are looking into the socket, and push it into the socket firmly.
8. The card is fully inserted when the gold connectors are almost completely concealed by the SO-DIMM socket and only the top of each connector is visible.

Warning: The card will not lock into place if it has not been fully inserted into the socket.

9. Once the card is fully inserted into the socket, press the card down until it locks into place. It is held in place by two tabs, one on either side of the card.

10. Replace the SO-DIMM door.
11. Reattach all cables and other devices, including the AC adapter, and power-on the computer.
12. Verify that the memory count displayed during the POST is correct. (See “Memory Checkout” on page 128 for information on memory size.)

Locations

System (Front View)

- 1** Latches
- 2** LCD
- 3** Keyboard
- 4** Click Buttons
- 5** TrackPoint III
- 6** Fn Key
- 7** Status Indicators

Service for U. S. and Canada

In the U. S. and Canada, the ThinkPad 370C and ThinkPad 360PE are serviced only through EasyServe.

This hardware maintenance manual covers information about the following IBM ThinkPad models:

- 355, 360, 750 (monochrome)
- 355C, 360C, 360CE, 370C, 750C, 755C (TFT color)
- 750Ce (TFT color, enhanced)
- 355Cs, 360Cs, 360CSE, 750Cs, 755Cs (STN color)
- 360P, 360PE, 750P (pen).

When information affects only a specific model, the model number is shown in parenthesis in the heading or is explained in the text. Before you go to the checkout guide, be sure to read this section.

- **Be extremely careful during write operations such as copying, saving, or formatting.** Drives in the computer that you are servicing might have been rearranged or the drive startup sequence might have been altered. If you select an incorrect drive, data or programs can be written over.
- **Replace FRUs only for the correct model.** When you replace the FRU, make sure the model of the machine and FRU part number are correct by referring to the part list.
- **FRUs should not be replaced because of a single, un-reproducible failure.** Single failures can occur from a variety of reasons that have nothing to do with a hardware defect such as: cosmic radiation, electrostatic discharge, or software errors. FRU replacement should only be considered when a recurring problem exists. If this is suspected, clear the error log and run the test again. Do not replace any FRUs if log errors do not reappear.

The servicer must include the following in the parts exchange form or part return form that is attached to the returned FRU.

- ___ 1. Name and phone number of servicer.
- ___ 2. Date of service.
- ___ 3. Date when part failed.
- ___ 4. Date of purchase.
- ___ 5. Failure symptoms, error codes appearing on display, and beep symptoms.
- ___ 6. Procedure index and page number in which failing FRU was detected.
- ___ 7. Failing FRU name and part number.
- ___ 8. Machine type, model number, and serial number.
- ___ 9. Customer's name and address.

What to Do First

Before checking problems with the computer, determine whether or not the damage applies to the warranty by referring to the following:

Note for Warranty: During the warranty period, the customer may be responsible for repair costs if the damage was caused by misuse, accident, modification, unsuitable physical or operating environment, or improper maintenance by the customer.

The following list provides some common items that are not covered under warranty and some symptoms that could indicate that the system was subjected to stresses beyond normal use.

Warranty Coverage Notes

The following is not covered under warranty:

- LCD panel cracked from being dropped or applying too much force.
- Scratched (cosmetic) parts.
- Cracked or broken plastic parts, broken latches, broken pins or connectors caused by excessive force.
- Damage caused by liquid spilled onto the system.
- Damage caused by improperly inserting a PCMCIA card or installation of an incompatible card.
- Damage due to foreign material in the FDD or FDD bay.
- Damage to the diskette drive caused by pressing the diskette drive cover or inserting diskettes with multiple labels.
- Diskette eject button was bent or damaged.
- Damage to the CD-ROM drive caused by excessive force shocked or dropped.
- Fuse blown by attaching non-supported device.
- Computer or hard disk could not be used because the password was forgotten.

If the following symptoms are present, they could indicate the damage was caused by non-warranted activity:

- Missing parts can be a symptom of unauthorized service or modification.
- HDD spindles can become noisy if subjected to excessive force or is dropped.
- I9990303 errors can be caused by exposure to strong magnetic fields.

How to Use Error Messages: Use the error codes displayed on the screen to diagnose failures. If more than one error code is displayed, begin the diagnosis with the first error code. The cause of the first error code can result in false error codes being displayed. If no error code is displayed, see if the error symptom is listed in the “Symptom-to-FRU Index” on page 216.

How to Diagnose Multiple FRUs: When the adapter or device has more than one FRU, the error code could be caused by either FRU. Before replacing multi-FRUs, try removing or exchanging each FRU, one by one in the designated sequence, to see if the symptoms change.

Passwords: The Passwords are security features that are used to protect the system and the hard disk data from unauthorized access. There are three types of passwords as follows:

- Power-on Password (POP)
- Hard disk Password (HDP)
- Supervisor Password (Privileged Access Password, PAP)

No overriding is provided. Obtaining permission from the password owner to unlock the password is a prerequisite for running diagnostic tests and performing maintenance service.

See “Password Combinations” on page 230 for more information about passwords.

How to Disable the Power-On Password:

Important

This information is not available in this HMM online format. See your IBM Servicer or IBM Authorized Dealer for this procedure.

Reset Pushbutton: The reset pushbutton resets the system regardless of the microcode status and forces power to be powered-off. Use this pushbutton to power-off when power is not completely off or the microcode is in a hung state. See “System Board (Top View)” on page 292 for the location of the pushbutton.

Port Replicator Problems: If you suspect a problem with the Port Replicator, see “Port Replicator Checkout” in the “Common Devices Checkout” section for more information.

General Checkout

Use the following procedure as a guide for computer problems.

Note: The diagnostic tests are intended to test *only* IBM products. Non-IBM products, prototype cards, or modified options can give false errors and invalid system responses.

1. Obtain the failing symptoms in as much detail as possible.
2. Verify the symptoms by attempting to recreate the failure by running the diagnostic test or by repeating the same operation.

Note: To run the diagnostics, refer to “How to Run the Diagnostics” on page 229.

3. Use the following table with the verified symptom to determine which page to go to. Search the symptoms column and find the description that best matches your symptom; then go to the page shown in the “Go to” column.

Symptom	Go to
Power failure. (The power indicator does not go on or stay on.)	“Power Systems Checkout” on page 207.
POST does not complete. No beeps/error code are indicated.	“Symptom-to-FRU Index” on page 216, and then use the No Beep Symptoms table.
POST beeps, but no error codes are displayed.	“Symptom-to-FRU Index” on page 216, and then use the Beep Symptoms table.
POST detected an error and displayed numeric error codes.	“Symptom-to-FRU Index” on page 216, and then use the Numeric Error Codes table.
The diagnostic test detected an error and displayed an FRU code.	“FRU Codes” on page 220.
The configuration is not the same as the installed devices.	“Checking the Installed Devices List” on page 230.
Other symptoms (such as LCD display problems).	“Symptom-to-FRU Index” on page 216, and then use other miscellaneous symptoms tables.
Symptoms cannot be recreated. (Intermittent problems.)	Use the customer reported symptoms and go to “Symptom-to-FRU Index” on page 216.
TV Tuner Problems	See “TV Tuner” on page 477.

Memory Checkout

Depending on the model, the memory size that is available for customer use appears differently. This is **not** a hardware problem. See the following table for the available memory size of each card.

Note: For Models 370C, 755C and 755Cs, one of two types of memory cards can be used, IC DRAM card or DIMM card. If DIMM cards are installed, replace IC DRAM with DIMM in the following.

IC DRAM	750, 750C, 750Cs, 750P	355x, 360x, 370C, 750Ce, 755C, 755Cs
0 MB	3904 KB	3712 KB
2 MB	5952 KB	5760 KB
4 MB	8000 KB	7808 KB
8 MB	12096 KB	11904 KB
16 MB	20288 KB	20096 KB

DIMM	370C, 755C, 755Cs
0 MB	3712 KB
4 MB	7808 KB
8 MB	11904 KB
12 MB	16000 KB
24 MB	28288 KB
16 MB	20096 KB
20 MB	24192 KB
32 MB	36480 KB

Memory errors might stop system operations, show error messages on the screen, or hang the system. The computer detects memory parity errors but does not correct them.

Use the following procedure to isolate memory problems.

Notes on Memory Errors

- For Models 355x, 360x, and 370C, ignore any references to parity errors.
- DIMM Adapter and DIMM card are not supported for 355x and 360x. Remove them (if installed).

1. Installing a non-parity memory card causes memory errors. Before you go to the next procedure, check whether or not the memory card use parity or non-parity. If the non-parity memory card is installed, disable the parity check on Easy-Setup configuration screen.
2. Make sure that the memory card is fully installed into the connector. Loose connection can cause an error.

3. Power-off the computer and remove the IC DRAM card, or DIMM card from its slot (if installed).
4. Press and hold the F1 key; then power-on the computer. Hold the F1 key down until Easy-Setup screen appears.
5. Select **Test** and press enter.
6. Select **Memory** and press enter to run the memory test on base memory. If an error appears, replace the system board.
7. Power-off the computer and reinstall the IC DRAM card; then power-on the computer. Verify the memory size; then test the memory. If an error appears, replace the IC DRAM card.

If memory problems occur intermittently, use the loop option to repeat the test. When the test detects an error, an error log is printed on the printer connected to the parallel port. See "Error Log" on page 229 for more information.

If a parity error is logged in CMOS, POST error code 118 appears when the power is turned on. To clear the log and to test the memory, run the memory diagnostic. If no error is detected by the test, the log is cleared, and error code 118 will not appear the next time the POST is run. If the 118 error code occurs repeatedly, determine and replace the failing memory FRU. FRUs should not be replaced because of a single, un-reproducible failure. Single failures can occur from a variety of reasons that have nothing to do with a hardware defect such as: cosmic radiation, electrostatic discharge, or software errors. FRUs replacement should only be considered when a recurring problems exists. If this is suspected, clear the error log and run the test again. Do not replace any FRUs if log errors do not reappear.

System Programs in Flash Memory: System setup programs and diagnostic tests are stored in Flash memory.

Flash Memory Update: A flash memory update is required for the following conditions:

- New versions of system programs.
- New feature or options are added.

When Updating Flash Memory

Do not power-off the computer, disconnect the Vac power, or remove the battery during the Flash update.

On certain systems, updating Flash memory can reset all customer's configuration settings to the default values.

To update the Flash memory, perform the following steps:

1. Connect the AC Adapter and install the battery pack.

2. Get the appropriate diskette which contains the update.
3. Insert the **System Program Service Diskette** into drive A and power-on the computer.
4. Select **Update system programs** from the menu.

System Board and Processor Card Checkout (370C, 750Ce, 755C, 755Cs)

The processing functions for the Models 370C, 750C, 755Ce, and 755Cs are performed by both the system board and the processor card. Processor problems can be caused by either FRU. However, the processor card generally has a lower probability of failure. When a numeric code calls the system board or the processor card as a FRU, or the processor card is called by a diagnostic test by showing FRU code 11, use the following procedure to isolate the problem.

1. Run the system board test to verify the symptom. This test verifies both the system board and the processor card. If no error is detected, return to "General Checkout" on page 200.
2. If FRU code 10 appears, replace the system board but do not replace the processor card. Transfer the processor card from the old system board to the new system board.
3. If FRU code 11 appears, reseal the processor card.
4. Rerun the test to verify the fix.
5. If FRU code 11 remains, replace the processor card.

If above procedure does not correct the problem, go to "Undetermined Problems" on page 227.

Keyboard/Auxiliary Input Device Checkout

Remove the external keyboard if the internal keyboard is to be tested.

If the internal keyboard does not work or an unexpected character appears, make sure that the three flexible cables extending from the keyboard are correctly seated in the connectors on the interposer card.

If the keyboard cable connection is correct, run the **Keyboard Test** by doing the following:

1. Go to diagnostic menu screen by pressing **Ctrl+A** in Easy-Setup screen.
2. Press **Ctrl+K**; the figure of the keyboard appears on the screen.
3. Check that when each key is pressed, the key position on the keyboard layout on the screen changes to be a black square.

Note: When a Fn key is pressed, the black square briefly appears.

If the tests detect a keyboard problem, do the following one at a time to correct the problem. Do not replace a non-defective FRU.

- Reseat the three cables.
- Replace the keyboard.
- Replace the interposer card.
- Replace the system board.

The following auxiliary input devices are supported for this computer.

- Numeric keypad
- Mouse (PS/2 compatible)
- External keyboard (with keyboard/mouse cable)

If any of the above devices do not work, reseat the cable connector and repeat the failing operation.

If the problem does not occur again, recheck the connector.

If the problem is not corrected, replace the device, and then the system board.

TrackPoint II checkout

If the TrackPoint II will not work, check the configuration in Easy-Setup by selecting **Keyboard** from the **Config** menu. If the configuration of the TrackPoint II disabled, select **TrackPoint** to enable it.

If this does not correct the TrackPoint II problem, continue with the following.

The TrackPoint II does automatic compensations to adjust the pointer sensor. During this process, the pointer moves on the screen automatically for a short time. This self-acting pointer movement can occur when a slight, steady pressure is applied to the TrackPoint II pointer while the computer is powered on or while the system is running, or re-adjustment is required because the temperature has exceeded its normal temperature range. This symptom does not indicate a hardware problem. No service actions are necessary if the pointer movement stops in a short period of time.

If a click button problem or pointing stick problem occurs, do the following:

1. Go to Easy-Setup screen.
2. Select an item with the pointing stick.
3. Press either the left or right click button.
4. Verify that both buttons work correctly.

If either the pointing stick or the click button will not work, do the following actions one at a time to correct the problem. Do not replace a non-defective FRU.

- Reseat the three keyboard cables.
- Replace the keyboard.
- Replace the interposer card.

- Replace the system board.

Pen and Digitizer Checkout (360P, 360PE, 750P)

To check the stylus pen and digitizer, do the following.

1. Press and hold the **F1** key.
2. Power-on the computer to go to Easy-Setup screen.
3. Select **Test** by using the stylus pen.
4. If the test menu appears, the pen and digitizer are operating correctly.

If the menu does not appear, do the following.

- a. Do the "Digitizer Adjustment."
- b. If the problem remains, replace the stylus pen.
- c. If the problem still remains after step 6 in the adjustment, replace the LCD assembly.

Digitizer Adjustment: Adjust the pen-point pressure when:

- The LCD is replaced with a new one.
- The LCD is changed to a pen LCD from a monochrome model.
- The stylus pen or digitizer is not working correctly.

Do the following:

1. Press and hold the **F1** key, then power-on the computer to go to the Easy-Setup menu.
2. Press **Ctrl+P**. The following **Pen** icon appears on the screen.

Pen

3. Open the LCD all the way to 180 degrees. (Do not convert it into the tablet-style notebook.)
4. Select the pen icon by moving the cursor on the icon and clicking it.
5. Without applying any pressure on the screen, hold the stylus pen so it stands on the screen, then press Enter.

Note: The pressure on the screen should only be from the weight of the stylus pen.

6. Restart the system.

Audio Card Checkout

Do the following to run the audio tests.

Note: Refer to "Product Overview" on page 232 to see whether the audio card is standard or not.

1. Power-off the computer.
2. Insert the **ThinkPad 750Ce hardware maintenance diskette** into diskette drive **A** and power-on the computer.

Note: You can use this maintenance diskette for all Models.

3. Select the Audio Diagnostics from the main menu.
4. Select **Tests** from the menu bar and press Enter.
5. Select **All tests** from the pull-down menu and press Enter.

Run options are set to test once and stop on error as defaults. Other options can be selected by the pull-down menu of **Setting-up**.

6. Follow the instructions that appear on the screen to proceed with the tests.
7. If the tests end and no errors are detected, the "All tests passed OK" message appears.
8. If an error is detected, the FRU code and error description message appear. Go to "FRU Codes" on page 220 and replace the FRU.
9. To exit from the test screen, press **Esc**.

Diskette Drive Test

Do the following to isolate the problem to a controller, drive, or diskette. A scratch, write enabled, non-defective 2HD diskette is required.

Warning: Make sure that the diskette does not have more than one label attached to it. Multiple labels can cause damage to the drive or can cause the drive to fail.

1. Do the following to select the test device:
 - a. Select the advanced diagnostic mode and select **Tool**;
 - b. Select the icon **FDD-1** or **FDD-2** and press the space key.

A ✓ mark appears next to the selected icon.

Insert the **blank** diskette when instructed.

2. Run the diskette drive test.
3. If the controller test detects an error, FRU code 10 appears. Replace the system board.
4. If the controller test runs without errors, the drive read/write tests start automatically.
5. If the drive test detects an error, FRU code 50 for FDD-1 or 51 for FDD-2 appears. If the diskette itself is known to be good, replace the drive.
6. If the drive is attached through a Port Replicator as FDD-1 or FDD-2 and the test detects errors, move the drive to the computer's diskette drive connector directly, and test it again as FDD-1.

If no errors occur at the FDD-1 position, the drive is not defective. Go to "Port Replicator Checkout" in "Common Devices Checkout" section to isolate the replicator problem.

7. If the drive is attached through an Expansion Unit, go to the service manual of the Expansion Unit to isolate the problem.

8. If the drive is attached through a Diskette Drive Attachment Unit, replace the unit.

Power Systems Checkout

To verify the symptom of the problem, power-on the computer using each of the power sources available as follows.

1. Remove the battery pack, diskette drive, and hard disk drive.
2. Connect the AC Adapter and check that power is supplied.
3. Install the diskette drive, or hard disk drive one at a time and check that power is supplied from each power source.
4. Disconnect the AC Adapter, remove the hard disk and diskette drive, and install the charged battery pack; then check that power is supplied by battery pack.

If you suspect a power problem, see the appropriate power supply check listed below.

- "Checking the AC Adapter." on page 208.
- "Checking Operational Charging" on page 208.
- "Checking the Battery Pack" on page 208.
- "Checking the Car-Battery Adapter" on page 210.
- "Checking the Quick Charger" on page 211.
- "Checking the Backup Battery" on page 211.
- "Checking the Standby Battery" on page 212.
- "Port Replicator Power Overload" on page 215.

Checking the AC Adapter: You are here because the computer fails only when the AC Adapter is used.

- If the power problem occurs only when the port replicator is used, replace the replicator.
- If the power-on indicator does not turn on, check the power cord of the AC Adapter for correct continuity and installation.
- If the operational charge does not work, go to "Checking Operational Charging" on page 208.

Note: There are two types of adapters. The procedure for checking both types is the same.

1. Unplug the AC Adapter cable from the computer and measure the output voltage at the plug of the AC Adapter cable. See the following figure.

Pin	Voltage (V dc)
1	+19.0 to +21.0
2	Ground

- If the voltage is correct, replace the system board. If the problem is not corrected, go to “Undetermined Problems” on page 227.
 - If the voltage is not correct, go to the next step.
2. Unplug the AC Adapter cable from the ac power outlet and wait five minutes or longer to allow the over voltage protection circuit to be fully discharged and initialized.
 3. Plug the AC Adapter cable into the ac power outlet.
 4. Measure the output voltage of the AC Adapter.
 5. If the voltage is still not correct, replace the AC Adapter.

Note: An audible noise from the AC Adapter does not always indicate a defective adapter.

Checking Operational Charging: To check operational charging, use a discharged battery pack or a battery pack that shows a yellow or orange battery status indicator when it installed in the computer.

Perform operational charging. If the battery status indicator turns orange and the battery charging indicator turns green within two minutes, replace the AC Adapter.

Checking the Battery Pack: Battery charging will not start until the Fuel-Gauge shows that less than 90% of the total power remains; with this condition the battery pack will charge to 100% of its capacity. This protects the battery pack from being over-charged or having a shortened life.

Notes:

- a. Models 355x and 360x battery pack does not contain a microprocessor. In the following, ignore any reference to the storage switch.
 - b. Before you perform the following procedure, check the following:
 - The correct battery pack is used for the model.
 - The storage switch set to on (I).
1. Power-off the computer.
 2. Remove the battery pack and measure the voltage between battery terminals 1 (+) and 4 (-). See the following figure.

Note: The following figure shows the battery for the Model 370C, 750x, 755C, and 755Cs. The battery for Models 355x and 360x, do not have the storage switch, but the battery terminals are the same.

Terminal	Voltage (V dc) / Signal
1	+8.0 to +16.0
2	Send
3	Thermal
4	Ground (-)
5	R1
6	Select
7	R2

Note: Signal lines, not used in these steps, are used for communication between the system and the battery. The storage switch is used to control the power to the internal microprocessor of the battery. The storage switch should be set to off (0) only when the battery is going to be kept in storage for more than two months.

- If the voltage is less than +8.0 V dc, the battery pack has been discharged or is defective. Recharge the battery. If the recharging does not work, go to Step 5 to check the charging circuit.

If the voltage is still less than +8.0 V dc after the recharging, replace the battery.

- If the voltage is more than +8.0 V dc, measure the resistance between battery terminals 3 and 4. The resistance must be 4 to 30 kilohms.

If the resistance is not correct, replace the battery pack.

If the resistance is correct, replace the DC/DC card.

- To check the charging circuit, do the following. Plug in the AC Adapter with the battery pack removed, then power-on the computer.
- Measure the charging voltage between DC/DC terminals 1 (+) and 4 (-).

- If the voltage is less than +9.0 V dc, replace the DC/DC card. If the voltage is more than +9.0 V dc, the charging circuit is working correctly, replace the battery pack.

Checking the Car-Battery Adapter: There are two types of adapters but the checkout procedure is the same for both of them.

- Unplug the Car-Battery Adapter cable from the computer.
- Plug the Car-Battery Adapter into the cigarette lighter socket.

Note: If the adapter is already plugged in, reseal it.

- Measure the output voltage of the Car-Battery Adapter cable. See the following figure.

Pin	Voltage (V dc)
1	+19.0 to +21.0
2	Ground

- If the voltage is correct and the power-on indicator on the Car-Battery Adapter is on all the time, the Car-Battery is working correctly. Replace the system board.
If the problem is not resolved when the system board is replaced, go to "Undetermined Problems" on page 227.
- If the voltage is outside the normal voltage range, do one of the following:
 - Try the above test procedures in a different car, if one is available.
 - Replace the Car-Battery Adapter if the computer works correctly with the AC Adapter.

Notes:

- If the output voltage from the cigarette lighter socket of the car is less than 10.5 V dc, the power-on indicator on the Car-Battery Adapter blinks and a continuous noise can be heard. The condition of the car battery should be checked by appropriate service personal.
- The Car-Battery Adapter does not support operational charging.

Checking the Quick Charger: There are two types of chargers, but checkout procedures are the same for both of them.

1. Ensure that the battery pack is operating correctly. (See “Checking the Battery Pack” on page 208.)
2. Connect the power cord to the quick charger and the other end to an ac power outlet. Ensure that the power-on indicator is on.
 - If the power-on indicator does not turn on, check the power cord for correct continuity and installation.
 - If the problem is not corrected, replace the quick charger or the power cord.
3. Install the battery pack into the quick charger.
 - If the charging indicator does not start blinking, replace the quick charger.

Checking the Backup Battery

1. Power-off the computer and unplug the AC Adapter from the computer.
2. Open the keyboard, and remove the battery pack and the diskette drive.
3. Remove the backup battery from the system board.
4. Measure the voltage of the backup battery. See the following figure.

Wire	Voltage (V dc)
Red	+2.5 to +3.7
Black	Ground

- If the voltage is correct, replace the system board.
- If the voltage is not correct, the backup battery has been discharged. Replace the backup battery.

- If the backup battery discharges quickly after replacement, replace the system board.

Checking the Standby Battery

1. Power-off the computer and unplug the AC Adapter from the computer.
2. Open the keyboard, and remove the battery pack and the diskette drive.
3. Remove the standby battery.
4. Measure the voltage of the standby battery.
 - If the voltage between red and black is 3.5 V dc or greater, the voltage is correct. Go to Step 10 on page 213 to verify standby battery operation.
 - If the voltage is less than 3.5 V dc, go to the next step.
5. Plug the AC Adapter into the computer and power-on the computer.
6. Measure the output voltage at the connector on the system board.

Pin	Voltage (V dc)
+	+4.0
-	Ground

- If the voltage is less than +4.0 V dc, replace the DC/DC card. If the voltage is still low, replace the system board.
 - If the voltage is more than +4.0 V dc, power-off the computer, replace the standby battery, and go to the next step.
7. Ensure that the AC Adapter is plugged into the computer; then power-on the computer.

8. Charging of the standby battery starts. A depleted battery needs approximately 30 minutes to be recharged to the operational voltage of +3.5 V dc.
9. Unplug the AC Adapter.
10. Verify the standby battery function by removing and installing the battery pack during suspend mode.

Note: Removing and installing the battery pack during suspend mode should be done within one minute. The resume operation must start. If the resume operation does not work, switching of power from the battery pack to standby battery will not be correct. Replace the DC/DC card.

If replacing the DC/DC card does not resolve the problem, replace the system board.

Power Management Features

Three power management modes are provided by the computer to save power consumption and prolong battery power.

Standby Mode: When in standby mode the following occurs:

- The LCD backlight turns off.
- The hard disk motor stops.
- The CPU clock is set to the lowest speed.

Events that cause entering of standby mode:

- Standby requested by the Fn key. (Fn+F3)
- No activity under **auto-standby** enabled by the feature utility.

Events that cause exiting or resuming of standby mode:

- (Resume) Any key operation.

Suspend Mode: When in suspend mode, the following, in addition to the four actions of standby mode, occur:

- The LCD power is powered-off.
- The hard disk is powered-off.
- The CPU is stopped.

In the ThinkPad Features Program, the computer can be set to "Will not suspend even if LCD is closed."

When the computer is powered with ac power and is used with one of the following IBM PC cards, the computer enters *standby mode*; the PC card and application program remain active.

- 3270 Emulation Credit Card Adapter
- 5250 Emulation Credit Card Adapter
- Token-Ring 16/4 Credit Card Adapter
- Credit Card Adapter for Ethernet

In the following condition, the computer cannot enter the suspend mode.

- While the communication link is running.
- When a serial mouse or other pointing device is selected in the **Config** menu of Easy-Setup.

Events that cause entering of suspend mode:

- Suspend mode is requested by the Fn key (Fn+F4).
- The LCD is closed.
- The keyboard is opened.
- The specified time has elapsed from the last operation with the keyboard, mouse, hard disk drive, parallel connector, diskette drive, or the AC Adapter is plugged in. The time is specified by **Suspend Timer** in the ThinkPad Features program.
- The battery condition is low. The battery power indicator blinks (orange).
- *The PS2 OFF* command is set in the ThinkPad Features program.

Events that cause exiting or resuming of suspend mode:

- (Resume) The LCD is opened.
- (Resume) The keyboard is closed.
- (Resume) Real time clock alarm signaled.
- (Resume) Ring indicator (RI) signaled by serial or PCMCIA device.
- (Resume) The Fn key is pressed.
- (Exit) Timer conditions are satisfied to enter hibernation mode.

Hibernation Mode: When in hibernation mode, the following occurs:

- The system status, RAM, VRAM, and setup data are stored on the hard disk.
- The system is powered-off.

The computer cannot enter hibernation mode when:

- A serial mouse or other pointing device is selected in the **Config** menu.
- The computer is powered with ac power and one of the following IBM PC cards is used.
 - PCMCIA Data/FAX Modem
 - High Speed PCMCIA Data/FAX Modem
 - 3270 Emulation Credit Card Adapter
 - 5250 Emulation Credit Card Adapter
 - Token-Ring 16/4 Credit Card Adapter
 - Credit Card Adapter for Ethernet

Events that cause entering of hibernation mode:

- The hibernation mode is requested by the Fn key (Fn+F12).
- Timer conditions are satisfied in suspend mode.
- Critical low battery condition.

Event that causes exiting of hibernation mode.

- The power-on switch is operated.

When power is turned on, the hibernation history of the boot record on the hard disk is recognized and system status is restored from the hard disk to resume operation.

Port Replicator Power Overload: If power shut downs occur intermittently when using PCMCIA-2 devices via a port replicator, suspect an over-current problem. Some PCMCIA devices use more power; if the maximum usage of each device occurs simultaneously, the total current will exceed the limit, thereby causing a power shut down. Isolate this problem by removing one of the devices, and use the computer under the same condition to see whether a power shut down occurs. Do this procedure for all devices, then determine the cause. Use of the larger AC Adapter (50W, optional) is recommended, if one is not yet in use.

Symptom-to-FRU Index

The Symptom-to-FRU Index lists the symptoms and errors and the possible causes. The most likely cause is listed first.

Note: Perform the FRU replacement or actions in the sequence shown in the “FRU/Action” columns. If a FRU did not solve the problem, put the original part back in the computer.

This index can also be used to help you decide which FRUs to have available when servicing a computer.

Numeric error codes show the errors detected in POST or system operation. In the following error codes, **X** can be any number.

If no codes are available, use narrative symptoms.

If the symptom is not listed, go to “Undetermined Problems” on page 227.

Notes:

- For IBM devices not supported by the diagnostic codes in this manual, see the manual for that device.
- If the LCD is replaced with a new one, see “Digitizer Adjustment” on page 205 to adjust the pen-point pressure.

Numeric Error Codes

Symptom/Error	FRU/Action
10X	1. System Board
110	<ol style="list-style-type: none"> 1. Go to “Memory Checkout” on page 201. 2. IC DRAM Card or DIMM Card 3. System Board
111	<ol style="list-style-type: none"> 1. Go to “Memory Checkout” on page 201. 2. Expansion Unit/Port Replicator 3. System Board
118 (Memory parity error was logged in CMOS.) (Go to “Memory Checkout” on page 201.)	1. Run memory diagnostics to clear the error log.
158 (HDP was not set even though the supervisor password is set.)	1. Set a HDP.
159 (HDP is not set the same as the supervisor password.)	1. Set a correct HDP.
161	<ol style="list-style-type: none"> 1. Go to “Checking the Backup Battery” on page 211. 2. Backup Battery 3. System Board
163 (Time and Date was not set.)	<ol style="list-style-type: none"> 1. Set Time and Date. 2. System Board
173 (Configuration data were lost.)	<ol style="list-style-type: none"> 1. Select OK in the error screen; then set time and date 2. Backup Battery 3. System Board
174 (Perform “Checking the Installed Devices List” on page 230 before changing any FRUs.)	<ol style="list-style-type: none"> 1. Check Device Configuration. 2. System Board 3. Diskette Drive Assembly 4. Hard Disk Drive Assembly
175, 177, 178	1. System Board
183 (Incorrect password entered at the supervisor password prompt.)	1. Have the user examine the password.
184 (POP check sum error.)	1. Reset the POP in Easy-Setup.

Symptom/Error	FRU/Action
185 (The startup sequence is not valid. Suspect that power was off when the startup sequence was being updated.)	1. Reset the startup sequence in Easy-Setup.
186	1. System Board
188	1. Set the system identification using the ThinkPad 750Ce hardware maintenance diskette. Note: You can use this maintenance diskette for all Models.
190 (Depleted battery pack was installed when the power was on.)	1. Go to “Checking the Battery Pack” on page 208.
191XX	1. System Board 2. Processor card (370C, 750Ce, 755C, and 755Cs)
195 (The configuration read from the hibernation area does not match the actual configuration.)	1. Check if the configuration was changed. For example, check if the disk drive is from another computer.
196 (Read error occurred in the hibernation area of the HDD.)	1. Run the hard disk drive test. 2. Hard Disk Drive
197 (The computer memory size is not equal to the hibernation area size on the HDD.)	1. Have the user disable then enable hibernation mode.
199XX	1. System Board
1XX	1. System Board
2XX	1. Go to “Memory Checkout” on page 201. 2. IC DRAM Card, DIMM, or DIMM Adapter 3. System Board

861X (Pointing device error when TrackPoint II is enabled.)	<ol style="list-style-type: none"> Reseat the keyboard Track Point II cable at the interposer card. 355x, 360x See "1040 Keyboard Unit" on page 241. 370C, 750x, 755C, 755Cs See "2040 Keyboard Unit" on page 265. Keyboard External Mouse System Board
I9990301 I9990302 I9990305	<ol style="list-style-type: none"> Reseat the boot device. Check the startup sequence for the correct boot device. Check that operating system has no failure, or is installed correctly.
I9990303	<ol style="list-style-type: none"> System Board
Other codes not listed above	<ol style="list-style-type: none"> Go to "Undetermined Problems" on page 227.

FRU Codes

If an error is detected by the diagnostic tests, a *four-digit* FRU code is displayed. The FRU code indicates two suspected FRUs. Replace the FRU that is indicated by the *two leftmost digits* first, then replace the FRU indicated by the *two rightmost digits*. No FRU is assigned to code 00. If only one FRU is suspected, the other FRU code is filled with zeros. See the referenced page before replacing the FRU.

FRU Code	FRU/Action
10	System Board
11	Processor Card (370C, 750Ce, 755C, and 755Cs)
15	Audio Card
20	Memory (See "Memory Checkout" on page 201.)
30	Reserved
32	External Keyboard
33	External Mouse
40	LCD Assembly (See "Digitizer Adjustment" on page 205 and important note for "LCD Related Symptoms" on page 223.)

FRU Code	FRU/Action
45	External CRT
50	<ol style="list-style-type: none"> 1. Reseat the Drive (FDD-1) 2. Diskette Drive (FDD-1)
51	<ol style="list-style-type: none"> 1. Reseat the Drive (FDD-2) 2. Diskette Drive (FDD-2)
60	<ol style="list-style-type: none"> 1. Reseat the Hard Disk Drive (HDD-1) 2. Hard Disk Drive (HDD-1)
61	<ol style="list-style-type: none"> 1. Reseat the Hard Disk Drive (HDD-2) 2. Hard Disk Drive (HDD-2)
70	PCMCIA-2 (Replicator)
80	Cellular Modem (370C, 750Ce, 755C, and 755Cs)
81	Internal Modem Card
90	Reserved

Note: The device ID and error codes are used to indicate the detail portion of the FRU which caused the error. If replacing a FRU does not correct a problem, see the Device ID or error code from the previous failure. If they have changed, the cause might be because the new FRU is defective or that the FRU was incorrectly installed.

If the problem remains after replacement of the FRUs, go to “Undetermined Problems” on page 227.

Beep Symptoms

Symptom/Error	FRU/Action
Continuous beeps.	System Board
One beep and a blank, unreadable, or flashing LCD.	<ol style="list-style-type: none"> 1. Reseat all LCD connectors. 2. LCD Assembly 3. System Board 4. DC/DC Card
One beep, and the message “Unable to access boot source.”	<ol style="list-style-type: none"> 1. Boot device 2. System Board
One long, two short beeps and a blank or unreadable LCD.	<ol style="list-style-type: none"> 1. System Board 2. LCD Assembly
One long beep followed by four short beeps each time the power switch is operated. (System cannot power-on due to low battery voltage.)	Connect the AC Adapter or install a fully-charged battery.
One beep every second. (System is shutting down due to low battery voltage.)	Connect the AC Adapter or install a fully-charged battery (allows system to complete shutdown before changing the battery).

Symptom/Error	FRU/Action
Two short beeps with error codes.	POST error. See “Numeric Error Codes” on page 217.
Two short beeps with blank screen.	System Board

No Beep Symptoms

Symptom/Error	FRU/Action
No beep, power-on indicator not on, and a blank LCD during POST.	<ol style="list-style-type: none"> 1. Go to “Power Systems Checkout” on page 207. 2. System Board 3. DC/DC Card 4. Power sources
No beep, power-on indicator on, and a blank LCD during POST.	<ol style="list-style-type: none"> 1. System Board 2. DC/DC Card 3. Processor Card (370C, 750Ce, 755C, 755Cs)
No beep, power-on indicator on, and a blinking cursor only during POST.	<ol style="list-style-type: none"> 1. System Board 2. Processor Card (370C, 750Ce, 755C, and 755Cs) 3. DC/DC Card
No beep during POST but system runs correctly.	<ol style="list-style-type: none"> 1. Turn the volume up and check the speaker 2. Speaker 3. Audio Card 4. DC/DC Card

LCD Related Symptoms

The TFT LCD of the notebook computers contain over 921 000 thin film transistors (TFTs). A small number of missing, discolored or lighted dots (on all the time) is characteristic of TFT LCD technology. Excessive pixel problems can cause viewing concerns. The LCD should be replaced if the number of missing or discolored, or lighted dots in any colored background is 21 or more.

Symptom/Error	FRU/Action
No beep, power-on indicator on, and a blank LCD during POST.	<ol style="list-style-type: none"> 1. System Board 2. DC/DC Card 3. Processor Card (370C, 750Ce, 755C, and 755Cs)
<ul style="list-style-type: none"> • LCD backlight not working, or • LCD too dark, or • LCD brightness cannot be adjusted, or • LCD contrast cannot be adjusted. 	<ol style="list-style-type: none"> 1. Reseat the LCD connectors. 2. LCD Assembly 3. Interposer Card 4. DC/DC Card
<ul style="list-style-type: none"> • LCD screen unreadable, or • Characters missing pels, or • Screen abnormal, or • Wrong color displayed. 	<ol style="list-style-type: none"> 1. See the preceding important note. 2. Reseat the all LCD connectors 3. LCD Assembly 4. System Board 5. Interposer Card
LCD has extra horizontal or vertical lines displayed.	<ol style="list-style-type: none"> 1. LCD Assembly

Keyboard/TrackPoint II Related Symptoms

Symptom/Error	FRU/Action
Keyboard (one or more keys) does not work.	<ol style="list-style-type: none"> 1. Reseat the three keyboard cables. 2. Keyboard 3. Interposer Card 4. System Board
TrackPoint II does not work.	<ol style="list-style-type: none"> 1. Go to “TrackPoint II checkout” on page 204. 2. Keyboard 3. Interposer Card 4. System Board
Pointer moves automatically or does not work correctly.	<ol style="list-style-type: none"> 1. See “TrackPoint II checkout” on page 204.

Indicator Related Symptoms

Symptom/Error	FRU/Action
Indicator incorrectly remains off or on, but system runs correctly.	<ol style="list-style-type: none">1. Reseat the status indicator cable.2. Status Indicator3. Interposer Card4. System Board
Battery power status indicator blinks from green, yellow, to orange.	<ol style="list-style-type: none">1. Check that a correct battery is installed.2. Set the battery storage switch to ON.3. Battery Pack4. DC/DC Card5. System Board

Power Related Symptoms

Symptom/Error	FRU/Action
Power shut down during operation.	<ol style="list-style-type: none">1. Go to “Power Systems Checkout” on page 207.2. Battery Pack3. Remove the battery pack and let it cool for two hours.4. DC/DC Card5. Power sources
The system will not power-off. (See “Reset Pushbutton” on page 199.)	<ol style="list-style-type: none">1. Press the Reset pushbutton.2. System Board

Function/Audio Related Symptoms

Symptom/Error	FRU/Action
The system will not suspend or resume by opening or closing the keyboard.	<ol style="list-style-type: none">1. Go to “Suspend Mode” on page 213 and check that the computer can enter suspend mode.2. Go to Easy-Setup screen and press Fn+4. If the computer enters suspend mode, suspect that the application program is defective.3. DC/DC Card4. Interposer Card5. System Board

Symptom/Error	FRU/Action
The system will not suspend or resume by opening or closing the LCD.	<ol style="list-style-type: none"> 1. Go to “Suspend Mode” on page 213 and that check that the computer can enter suspend mode. 2. Go to Easy-Setup screen and press Fn+4. If the computer enter suspend mode, suspect that the application program is defective. 3. Interposer Card 4. DC/DC Card 5. System Board
Battery Fuel-Gauge does not go higher than 90%.	<ol style="list-style-type: none"> 1. Go to “Checking the Battery Pack” on page 208 and see the note.
Audio problems.	<ol style="list-style-type: none"> 1. Run the Audio Test. 2. Audio Card
Memory count (size) appears differently from actual size.	<ol style="list-style-type: none"> 1. Go to “Memory Checkout” on page 201.
System configuration does not match the installed devices.	<ol style="list-style-type: none"> 1. Go to “Checking the Installed Devices List” on page 230.
System hangs intermittently.	<ol style="list-style-type: none"> 1. Go to “Intermittent Problems” on page 226.

Peripheral Device Related Symptoms

Symptom/Error	FRU/Action
External display does not work correctly.	<ol style="list-style-type: none"> 1. See “External Display Self-Test” in “Common Devices Checkout” section.
Printer problems.	<ol style="list-style-type: none"> 1. Run Printer Self-test. 2. System Board 3. Parallel Port Device 4. Cable
Serial or parallel port device problems.	<ol style="list-style-type: none"> 1. Device 2. Device Cable 3. System Board

Other Symptoms

Symptom/Error	FRU/Action
Stylus pen or digitizer does not work correctly.	1. Go to “Pen and Digitizer Checkout (360P, 360PE, 750P)” on page 205.
Errors occur only when Port Replicator is used.	1. See “Port Replicator Checkout” in “Common Devices Checkout” section.
PCMCIA slot pin is damaged.	1. PCMCIA Slots Assembly

Note: If you cannot find a symptom or error in this list and the problem remains, see “Undetermined Problems” on page 227.

Intermittent Problems

Intermittent system hang problems can be caused by a variety of reasons that have nothing to do with a hardware defect such as: cosmic radiation, electrostatic discharge, or software errors. FRUs replacement should only be considered when a recurring problems exists.

When analyzing the intermittent problem, do the following:

1. Run the advanced diagnostic test for the system board in loop mode at least 10 times.
2. If no error is detected, do **not** replace any FRUs.
3. If any error is detected, replace the FRU shown by the FRU code. Rerun the test to verify that no more errors exist.

Undetermined Problems

You are here because the diagnostic tests did not identify which adapter or device failed, installed devices are incorrect, a short circuit is suspected, or the system is inoperative. Follow the procedures below to isolate the failing FRU (do not isolate non-defective FRUs).

Verify that all attached devices are supported by the computers.

Verify that the power supply being used at the time of the failure is operating correctly. (See "Power Systems Checkout" on page 207.)

1. Power-off the computer.
2. Check the cables, wires, and connectors for short circuits and open circuits. Visually check them for damage. If any problems are found, replace the FRU.
3. Remove or disconnect all of the following devices.
 - a. Non-IBM devices
 - b. Devices attached to the expansion bus connector
 - c. Printer, mouse, and other external devices
 - d. Battery pack
 - e. Hard disk drive
 - f. Diskette drive or the device attached to the diskette drive connector
 - g. IC DRAM card or DIMM card
 - h. PC cards

Note: Remember that removing the hard disk drive, an IC DRAM card, or any adapter or device, might cause configuration errors. Ignore error code 174.

4. Power-on the computer.
5. Determine if the problem has changed.
6. If the problem does not occur again, reconnect the removed devices one at a time until you find the failing FRU.
7. If the problem remains, replace the following FRUs one at a time. Do not replace a non-defective FRU.
 - DC/DC card
 - Audio card
 - Interposer card
 - LCD assembly
 - System board
 - Processor card (370C, 750Ce, 755C, and 755Cs)

Related Service Procedures

This section provides information about the following:

- “Status Indicators”
- “How to Run the Diagnostics” on page 229
- “Error Log” on page 229
- “Checking the Installed Devices List” on page 230
- “Password Combinations” on page 230
- “How to Run the Low Level Format” on page 230
- “PC Test Card LED” on page 231
- “Fn Key Combinations” on page 231
- “How To Run the Keyboard Diagnostics” on page 231

Status Indicators

The system status indicators show the current computer status in different colors (green, yellow, and orange).

Symbol	Color	Meaning
	Blinking green	Speaker sounds (Does not sound for Models 355, 355Cs, 360, 360Cs, and 370C.)
	Green	Battery fully charged
	Yellow	Battery usable
	Orange	Battery low
	Blinking orange	Battery almost depleted
	Blinking green, yellow, and orange	Battery storage switch is set off
	Green	Battery charging
	Orange	PC card in-use
	Orange	Diskette drive in-use
	Orange	Hard disk drive in-use
	Green	Keys in Num Lock mode
	Green	Keys in Caps Lock mode
	Green	Keys in Scroll Lock mode

Symbol	Color	Meaning
	Green	Computer in suspend mode
	Blinking green	Computer resuming normal mode
	Green	Computer powered on

How to Run the Diagnostics

Use either the TrackPoint II or the cursor move keys to interact with the tests. The Enter key works the same as selecting the OK icon to reply OK.

1. Press and hold the F1 key; then power-on the computer. Hold the F1 key down until Easy-setup screen appears.
 2. Select **Test** and press Enter.
 3. Select a device and press Enter to run the test.
 4. The test progress screen appears.
 5. **OK** appears when the test ends without any errors.
 6. Start the **Advanced Diagnostic test** by pressing **Ctrl+A** on the basic diagnostic menu screen.
 7. Select **Tool** to install the tools.
 8. Select a device, press the **space** key, and install the tool. Multiple devices can be selected by repeating this step.
- A √ mark appears for the selected device.
9. Select **OK** and press Enter if the selection is OK.
 10. Select a device and press Enter to start the tests.
 11. Select **Test All** to test all devices.
 12. Select **Loop Test** to loop tests.

A loop option menu appears in which a device loop or all loop can be selected. Select a device and press the **space** key to select a device. Repeat this step to select multiple devices. Press Enter to start the diagnostic loop. If no device is selected, all device tests are looped.

13. To exit the loop, keep pressing **Ctrl+Pause** until the test exits. A beep sounds (750Ce, 755C, 755Cs) to notify that the exit interrupt is sensed by the test program.

Error Log

Diagnostic errors are printed on the printer that is attached to the parallel port when the error is detected. The error is also logged in the system memory.

Do the following procedure to display the errors.

1. End the test, if it is running.
2. Press **Ctrl+A** to select the advanced diagnostic mode.
3. Press **Ctrl+E**.
4. The error log appears.

5. To exit the screen, select the cancel icon or press Esc.

The error log is not saved when system power is powered-off.

Checking the Installed Devices List

If a device is installed but the icon appears in a gray shade rather than a dark shade on the basic diagnostics screen, the device is defective. Reseat the device connectors. If the symptom remains, replace the device or the system board. If needed, adjust the contrast control to clearly distinguish the shades of the icon.

If a device that is not installed appears in a dark shade, for example, FDD-2 appears in a dark shade when *NO* second FDD is installed, do the following.

1. Replace the **first** device, such as a FDD-1, HDD-1, or PCMCIA-1.
2. If the problem remains, replace the system board.

PCMCIA-1, Parallel, and Serial icons are always displayed in dark shade, because the icons represent subsystems of the system board and not attachment of the devices.

The HDD-1, FDD-1, or PCMCIA-1 represents the **first** drive in the system configuration, respectively. Similarly, the HDD-2, FDD-2, or PCMCIA-2 represents the **second** drive, usually attached through a port replicator or an expansion unit.

Password Combinations

The password relationship is:

- ***When POP is the same as HDP***
The POP prompt appears, but the HDP prompt does not appear.
- ***When POP is not the same as HDP***
Both POP and HDP prompts appear.
- ***PAP and HDP***
When PAP is used, the HDP is enabled automatically, but no HDP prompt appears. The HDP is set the same as PAP.

How to Run the Low Level Format

Do the following to format the hard disk. **Warning:** Make sure the drive address to be formatted is correct. This procedure will erase all information on the disk.

1. Power-off the computer.
2. Insert the **ThinkPad 750Ce hardware maintenance diskette** into diskette drive **A** and power-on the computer.

Note: You can use this maintenance diskette for all Models.

3. Select **Format the hard disk** from the main menu.
4. Select the drive from the menu.
5. Follow the instructions on the screen.

PC Test Card LED

The green LED on the PC test card turns on when the PCMCIA test is running. If the LED does not turn on, check that the card is installed correctly by reseating the card. If it still does not turn on after it is reseated, try using another slot for the test. If the LED still does not turn on and the test fails, replace the FRU shown in the diagnostic error code.

Fn Key Combinations

The following table shows the **Fn** key and function key combinations and their corresponding functions.

The Fn key works independently from the operating system. The operating system obtains the status through the system management interface to control the system.

Fn +	Description
F1	Reserved
F2	Fuel-gauge display ON/OFF
F3	Standby mode invocation
F4	Suspend mode invocation
F5	Audio volume Down
F6	Audio volume UP
F7	LCD/CRT display switching
F8	LCD normal/reverse switching
F9	Reserved
F10	Reserved
F11	Power management mode switching (Toggles High power, Intelligent, Economy)
F12	Hibernation invocation

How To Run the Keyboard Diagnostics

Do the following to run the keyboard test.

1. Go to the advanced diagnostic screen menu by pressing **Ctrl+A** in Easy-Setup menu.
2. Go to the keyboard diagnostic test menu by pressing **Ctrl+K**.
3. Check that when each key is pressed, the key position on the keyboard layout on the screen changes to be a black square.

Note: When a Fn key is pressed, the black square briefly appears.

Product Overview

The following table shows a brief overview of the system features.

Models 355x, 360x

Feature	Description
Processor	<ul style="list-style-type: none">• 355x, 360, 360C, 360Cs, 360P<ul style="list-style-type: none">– SL Enhanced 486SX 33 MHz, solder mounted on the system board• 360CE, 360CSE, 360PE<ul style="list-style-type: none">– SL Enhanced 486DX2 50/25 MHz, on the system board
Bus Architecture	<ul style="list-style-type: none">• AT Bus• VESA local bus for video subsystem
Memory (Standard)	4MB (on the system board)
Memory (Option)	2, 4, 8, 16MB, Basic IC DRAM card (max. 16 MB)
CMOS RAM	128 Bytes
VGA Video	<ul style="list-style-type: none">• 355, 360<ul style="list-style-type: none">– 9.5-inch (diagonally), 64 gray level, STN LCD monochrome• 355Cs, 360Cs, 360CSE, 360P, 360PE<ul style="list-style-type: none">– 9.5-inch (diagonally), 256/4096 color, DSTN LCD color• 355C, 360C, 360CE<ul style="list-style-type: none">– 8.4-inch (diagonally), 256/256K color, TFT LCD color

Hard Disk Drive (Removable)	<ul style="list-style-type: none"> • 170MB, 2.5-inch • 340MB, 2.5-inch • 540MB, 2.5-inch
Audio Card	Microphone and headphone jacks with built-in microphone
PCMCIA	One Type-III or two Type II

FRU Removals and Replacements

This section contains information about removals and replacements.

- The system board is sensitive to, and can be damaged by, electrostatic discharge. Establish personal grounding by touching a ground point with one hand before touching these units.

An electrostatic discharge (ESD) strap must be used to establish personal grounding.

- Do not damage any part. Only certified trained personnel should service the computer.
- The arrows in the “Removals and Replacements” section show the direction of movement to remove a FRU, or to turn a screw to release the FRU. The arrows are marked in numeric order, in square callouts, to show the correct sequence of removal.
- When other FRUs must be removed before removing the failing FRU, they are listed at the top of the page.
- To replace a FRU, reverse the removal procedure and follow any notes that pertain to replacement. See “Locations” for internal cable connections and arrangement information.
- When replacing a FRU, use the correct screw size as shown in the procedures.

Safety Notice 8: Translation on page 13

Before removing any FRU, power-off the computer, unplug all power cords from electrical outlets, remove the battery pack, and then disconnect any interconnecting cables.

Safety Notice 3: Translation on page 9

The battery pack contains small amounts of nickel. Do not disassemble it, throw it into fire or water, or short-circuit it. Dispose of the battery pack as required by local ordinances or regulations.

Safety Notice 1: Translation on page 7

Before the computer is powered-on after FRU replacement, make sure all screws, springs, or other small parts, are in place and are not left loose inside the computer. Verify this by shaking the computer and listening for rattling sounds. Metallic parts or metal flakes can cause electrical shorts.

Removals Models 355x, 360x

1010 Rear Connector Door

Remove the center latch **1**; then remove the rear connector door by flexing it **2**.

1015 Foot

To replace the foot:

- Align the foot in the open position with one pivot in its hinge in the base cover
- Press the other pivot point into position with your thumb or finger

1020 Battery Pack

Notes:

1. Be careful that the computer does not fall backward when the battery pack is removed.
2. Check that the keyboard latch springs are in place.

1030 Diskette Drive

- Battery Pack (1020)

Warning:

1. **Check that the backup and standby batteries are seated correctly to prevent damage to the diskette drive.**
2. **Do not put any pressure on the diskette drive cover.** Remove the diskette drive exactly as shown in the figure.
3. **Make sure that a diskette is not installed in the drive.** Removing the drive with a diskette installed causes bending or damaging the eject button.

After replacing the diskette drive, latch the removal strap into the correct position.

1035 Hard Disk Drive

- Battery Pack (1020)

Warning:

1. **Do not apply any extra force to the hard disk drive when removing it.** Remove the hard disk drive exactly as shown in the figure.
2. **Do not drop or apply any shock to the hard disk drive.** The hard disk drive is sensitive to physical shock. Incorrect handling can damage it or cause permanent loss of data. Before removing the hard disk drive, have the user make a backup copy of all information on the hard disk. Never remove the hard disk drive while the system is operating or is in suspend mode.

After replacing the hard disk drive, latch the removal strap into the correct position.

1040 Keyboard Unit

- Battery Pack (1020)

- 1** When removing the screw covers, use a small screwdriver as shown.
- 2** **Warning:** When using a screwdriver to remove cover or latches, be careful not to:
 - **Scratch the surface of the computer.**
 - **Break the latches.**
- 3** Open the keyboard.
- 4** Remove the leaf-spring plate.
- 5** When unlatching the upper cover latches to remove the upper cover, use a small screwdriver as shown.

Track Point II Cable

- 6** Remove the upper cover.
Note: To remove the upper cover, do not latch the keyboard. Lower the keyboard and remove the upper cover.
- 7** Disconnect the cables to remove the keyboard unit as shown.
Warning: Do not pull the keyboard cables. The keyboard cables can be damaged if the keyboard is disconnected without releasing the three latches **7**.
- 8** Remove the keyboard.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
2	Upper cover (2)	8 mm
Note: Make sure you use the correct screw.		

Notes for when replacing:

1. When replacing the keyboard, check that the three cables are clean, and inserted straight and fully into the connectors. Slide both ends of each latch at the same time to make sure that each cable is correctly inserted.

Warning: While pressing the cables into place, be careful not to break the flexible cables.

Go to “Keyboard/Auxiliary Input Device Checkout” on page 203 and test all keys before returning the computer to the customer.

2. When replacing the upper cover, insert the two latches located on the rear side of the cover into the guide of the LCD foot; then push the right, left, and front sides to snap them into place. **Be careful not to damage the suspend/resume switch when putting on the cover.**

1050 IC DRAM Card

- Battery Pack (1020)
- Diskette Drive (1030)

Warning: The IC DRAM card is sensitive to physical shock. Incorrect handling of the card can damage it. The eject tape (P/N 53G9318) must be used to remove the card.

1055 Diskette Drive Bezel

- Battery Pack (1020)
- Diskette Drive(1030)

Insert a coin between the diskette drive bezel and the computer as shown **1** and push the bezel from the bottom of the computer **2** to remove it.

1060 Status Indicator

- Battery Pack (1020)
- Keyboard Unit (1040)

Warning: Do not pull the status indicator cable. The cable can be damaged if the indicator is disconnected (in step 2) without releasing the latch.

The status indicator has three latches on its rear side and one on its front side. For step **3**, do the following:

1. Release the rear latches by pushing each one with your thumb, as shown in the figure. (The broken circles in the figure show the locations of the three latches.)
2. Release the front latch.
3. Lift the indicator.

Note: When replacing the indicator, insert the flexible cable straight into the connector until the head of the cable stops. Slide both ends of the latches at the same time to make sure that the cable is correctly inserted.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	Indicator bracket (2)	4 mm
Note: Make sure you use the correct screw.		

1070 LCD Assembly

- Battery Pack (1020)
- Keyboard Unit (1040)
- Status Indicator (1060)

LCD Connector

355Cs, 360Cs

355, 360

360P

355C, 360C

- 1** When replacing the LCD ground-terminal screw, do not pull or push the LCD cables.

- 2 When removing the LCD cables, pull the connector straight up. Incorrect handling can damage the connector.
Note: For the color model, make sure the indicator does not hook the most right LCD connector when replacing the status indicator.
- 3 Remove the screw.
- 4 Remove the right hinge cover.
- 5 When removing the left hinge cover, use a small screwdriver as shown to release the latch from the rear base cover. Pull the hinge cover slightly upward to keep it unlatched.
- 6 From the front side, remove the latch with a small screwdriver as shown to remove the cover. **Be careful not to scratch the surface of the computer when you use a screwdriver to remove the latches.**
- 7 Remove the four screws.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	LCD ground-terminal (1)	4 mm
3	LCD hinge cover, right (1)	4 mm
7	LCD hinge (4)	4 mm
Note: Make sure you use the correct screw.		

Safety Notice 5: Translation on page 11

If the LCD breaks and the fluid from inside the LCD gets into your eyes or on your hands, immediately wash the affected areas with water for at least 15 minutes. Seek medical care if any symptoms from the fluid are present after washing.

Caring for the LCD

- When cleaning of the LCD becomes necessary, gently wipe the LCD with a dry, soft cloth. Do not use alcohol or detergent to clean the LCD.
- To avoid damage to the LCD, do not scratch or apply any force to its surface.
- Do not put anything on the surface of the LCD.

1080 Modem Card (355x)

1085 Bezel (360x)

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1035)
- Keyboard Unit (1040)
- Status Indicator (1060)

Notes:

1. For Model 360x, use steps **9** through **12** to remove the bezel.
2. When the audio card is installed in Model 360x, modem card means audio card in the following step.

For the modem card:

or

For the audio card:

Notes:

1. Gently lift the audio card in step **7** to avoid damaging the speaker cable.
2. Do not pull the speaker cable **8** before the audio card is removed **7**.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1a	Speaker shield (2)	4 mm
1b	Diskette drive connector (2)	6 mm
5	Lower Shield (2)	4 mm

Note: Make sure you use the correct screw.

Note: When you reinstall the upper shield, make sure the LCD ground-terminal is located correctly as shown in the circle.

1090 Speaker Shield Assembly

1095 Interposer Card

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1035)
- Keyboard Unit (1040)
- Status Indicator (1060)
- LCD Assembly (1070)
- Modem Card (1080)

Warning: Carefully remove any metal particles that might have flaked off. Be careful not to damage it with a screwdrivers, screws, or other objects.

- 2** When replacing the speaker shield, insert it under the projection at the left, rear corner of the computer base.

Note: The shaded part in the figure is attached to the speaker shield assembly with light adhesive. This is a separate FRU from the speaker shield assembly.

- 3** When raising the speaker shield assembly, make sure that the shield assembly does not hook the three flexible cables of the keyboard. For Model 360, gently raise the speaker shield assembly to avoid damaging the speaker cable. (For Models 355 and 355Cs, skip step **3**; the speaker cable has already been removed.)

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1a	Speaker shield (1)	4 mm
1b	Hard disk drive connector (2)	6 mm
1c	System board (1)	16 mm
1d	System board, spacer (1)	16 mm

Note: Make sure you use the correct screw.

Notes:

1. Verify that the spacer **1d** is in the correct position.
2. **2** is a shield for radio frequency interference.

1100 DC/DC Card

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1035)
- Keyboard Unit (1040)
- Status Indicator (1060)
- LCD Assembly (1070)
- Speaker Shield Assembly (1090)
- Modem Card (1080)
- Interposer Card (1095)

Notes:

1. When replacing the DC/DC card, put the spacer **5** on the screw hole.
2. DC-in holder **A** and spacer **5** are supplied as miscellaneous parts.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
3	Power jack (1)	8 mm (flat head)
Note: Make sure you use the correct screw.		

1110 Backup Battery

1115 Standby Battery

- Battery Pack (1020)
- Diskette Drive (1030)

- 4** Backup Battery
- 3** Standby Battery

Note: When replacing the batteries, make sure both are seated correctly. Check that the insulator cover **1** is in the correct position by sliding its end to end.

Step	Location (Quantity)	Length
1	cover (1)	4 mm
Note: Make sure you use the correct screw.		

Safety Notice 2: Translation on page 8

The standby battery contains a small amount of nickel and cadmium. Do not disassemble it, recharge it, throw it into fire or water, or short-circuit it. Dispose of the battery as required by local ordinances or regulations.

Safety Notice 4: Translation on page 10

The backup battery is a lithium battery and can cause a fire, explosion, or severe burn. Do not recharge it, remove its polarized connector, disassemble it, heat it above 100°C (212°F), incinerate it, or expose its cell contents to water. Dispose of the battery as required by local ordinances or regulations. Use of an incorrect battery can result in ignition or explosion of the battery. Replacement batteries can be ordered from IBM or IBM Authorized Dealers.

1120 System Board Assembly

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1035)
- Keyboard Unit (1040)
- Status Indicator (1060)
- LCD Assembly (1070)
- Modem Card (1080)
- Speaker Shield Assembly (1090)
- Interposer Card (1095)
- DC/DC Card (1100)
- Backup Battery (1110)
- Standby Battery (1115)

Important

The EEPROM on the system board contains the vital product data (VPD), that is, system unit serial number, system board serial number, and other computer unique data. When the system board is replaced, the system unit serial number must also be restored. Use the **Set system identification** utility on the maintenance diskette to restore the number.

Do not power-off the computer when restoring the VPD.

The serial number label is attached to the bottom cover.

Notes:

1. Before removing and replacing the system board, make sure that the PCMCIA cards are removed and the eject levers are not sticking out.
2. When replacing the system board assembly, align the power-key slide hub with the power-switch actuator by moving the power-key in the direction of the arrow. See the large circle in the figure. Before tightening any screws, check that the power-switch operates correctly.
3. Do not pull the PCMCIA slot assembly while removing the system board.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	Hinge bracket (4)	4 mm
2	Base cover, lower shield (1)	4 mm
Note: Make sure you use the correct screw.		

1130 PCMCIA Slot Assembly

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1035)
- Keyboard Unit (1040)
- Status Indicator (1060)
- LCD Assembly (1070)
- Modem Card (1080)
- Speaker Shield Assembly (1090)
- Interposer Card (1095)
- DC/DC Card (1100)
- Backup Battery (1110)
- Standby Battery (1115)
- System Board Assembly (1120)

Warning: The system board can be damaged if the lower shield touches the system board components. Carefully follow the next instruction.

In step **4**, gradually raise the system board from the lower shield until all the components of the system board just clear the tabs of the lower shield. Be careful not to raise it too far. While keeping the clearance to a minimum, separate the system board from the lower shield by moving the system board straight forward as shown by step **2**.

Notes:

1. When handling the PCMCIA slot assembly, be careful not to disassemble any part of it. The slot assembly is not solidly fixed when it is removed from the system board or the FRU.
2. The screw stand-off located each corner of the PCMCIA slot, is easy to remove. Make sure that the screw stand-off is positioned when replacing the slot. Do not replace the slot without the screw stand.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	PCMCIA slot, upper (2)	12 mm
2	PCMCIA slot, lower (2)	14 mm
Note: Make sure you use the correct screw.		

Removals Models 370C, 750x, 755C, 755Cs

2010 Rear Connector Door

Remove the center latch **1**; then remove the rear connector door by flexing it **2**.

2015 Foot

To replace the foot:

- Align the foot in the open position with one pivot in its hinge in the base cover
- Press the other pivot point into position with your thumb or finger

2020 Battery Pack

Notes:

1. Be careful that the computer does not fall backward when the battery pack is removed.
2. When replacing the battery pack, check that the storage switch of the new battery is set to the on (I) position. Do not operate the storage switch of a battery that has been used and is going to be re-used.
3. Check that the keyboard latch springs are in place.

2030 Diskette Drive

- Battery Pack (2020)

Warning:

1. **Check that the backup battery and standby battery are seated correctly to prevent damage to the diskette drive** when replacing the diskette drive.
2. **Do not put any pressure on the diskette drive cover.** Remove the diskette drive exactly as shown in the figure.
3. **Make sure that a diskette is not installed in the drive.** Removing the drive with a diskette installed causes bending or damaging the eject button.

After replacing the diskette drive, latch the removal strap into the correct position.

2035 Hard Disk Drive

- Battery Pack (2020)

Warning:

1. **Do not apply any extra force to the hard disk drive when removing it.** Remove the hard disk drive exactly as shown in the figure.
2. **Do not drop or apply any shock to the hard disk drive.** The hard disk drive is sensitive to physical shock. Incorrect handling can cause damage it, and cause permanent loss of data on the hard disk. Before removing the hard disk drive, have the user make a backup copy of all the information on the hard disk. Never remove the hard disk drive while the system is operating or is in suspend mode.

After replacing the hard disk drive, latch the removal strap into the correct position.

2040 Keyboard Unit

- Battery Pack (2020)

- 1** When removing the screw covers, use a small screwdriver as shown.
- 2** **Warning:** When using a screwdriver to remove cover or latches, be careful not to:
 - **Scratch the surface of the computer.**
 - **Break the latches.**
- 3** Open the keyboard.
- 4** Remove the leaf-spring plate.
- 5** When unlatching the upper cover latches to remove the upper cover, use a small screwdriver as shown.

Track Point II Cable

- 6** Remove the upper cover.
Note: To remove the upper cover, do not latch the keyboard. Lower the keyboard and remove the upper cover.
- 7** Disconnect the cables to remove the keyboard unit as shown.
Warning: Do not pull the keyboard cables. The keyboard cables can be damaged if the keyboard is disconnected without releasing the three latches.
- 8** Remove the keyboard.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
2	Upper cover (2)	8 mm
Note: Make sure you use the correct screw.		

Notes for when replacing:

1. When replacing the keyboard, check that the three cables are clean, and inserted straight and fully into the connectors. Slide both ends of each latch at the same time to make sure that each cable is correctly inserted. Go to “Keyboard/Auxiliary Input Device Checkout” on page 203 and test all keys before returning the computer to the customer.
2. When replacing the upper cover, insert the two latches located rear side of the cover into the guide of the foot of the LCD; push the right, left, and front sides to snap into place. **Be careful not to damage the suspend/resume switch when putting on the cover.**

2050 IC DRAM Card

- Battery Pack (2020)
- Diskette Drive (2030)

For Models 370C, 755C and 755Cs, one of two types of memory card can be used, IC DRAM card or DIMM card.

Warning: The IC DRAM card is sensitive to physical shock. Incorrect handling of the card can damage it. The eject tape (P/N 53G9318) must be used to remove the card.

Note: For Models 370C, 755C and 755Cs, one of the following combinations occupies the slot depending on the configuration.

- IC DRAM card + IC DRAM card base
- DIMMs on DIMM adapter

2055 DIMM and DIMM Adapter (755C, 755Cs)

- Battery Pack (2020)
- Diskette Drive (2030)

Press both locks at the same time and remove the DIMM.

While holding the strap **1**, pull the DIMM adapter toward the front **2** to remove it.

Notes:

1. If the IC DRAM cards or the DIMM are not installed and the base plate is installed instead of these card, remove the plate as follows:
 - a. Pinch the projection **1** on the left side of the plate; then pull the plate slightly toward the front **2**.
 - b. Raise the rear portion of the plate **3** and remove it.

2. When inserting the DIMM into either connector on the DIMM adapter:
 - a. Locate the triangle **2** on the right side of the socket.
 - b. With the notched end of the DIMM **1** toward the triangle, insert the DIMM into the socket.
 - c. Pivot the DIMM until it snaps into place.

If you have another DIMM to install, insert it in the other socket the same way.

2056 Diskette Drive Bezel

- Battery Pack (2020)
- Diskette Drive(2030)

Insert a coin between the diskette drive bezel and the computer as shown **1** and push the bezel from the bottom of the computer **2** to remove it.

2060 Status Indicator

- Battery Pack (2020)
- Keyboard Unit (2040)

Warning: Do not pull the status indicator cable. The cable will be damaged if the status indicator is disconnected without releasing the latch in step **2**.

The status indicator has three latches on its rear and two in its front. In step **3**, do as follows:

1. Release the rear latches with pushing each one with your thumb, as shown in the artwork. (The broken circles in the figure show the locations of the three latches.)
2. Release the front latches.
3. Lift the indicator.

Note: When replacing the indicator, insert the flexible cable straight into the connector until the head of the cable stops. Slide both ends of the latches at the same time to make sure that the cable is correctly inserted.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	Indicator bracket (2)	4 mm
Note: Make sure you use the correct screw.		

2070 LCD Assembly

- Battery Pack (2020)
- Keyboard Unit (2040)
- Status Indicator (2060)

LCD Connector

Screw holds two flexible cables.

This figure shows the LCD that does not have a contrast control.
(P/N 84G4337)

Important

- Two types of LCDs are available for the Model 755C: one with a contrast control and one without. Make sure that you replace the LCD with the correct type.
- The LCD for the Model 370C does not have a contrast control.

1 When replacing the LCD ground-terminal screw, do not pull or push the LCD cables.

2 When removing the LCD cables, pull the connector straight up. Incorrect handling can damage the connector.

Note: For the color models, make sure the indicator does not catch the right LCD connector when replacing the status indicator.

3 Remove the screw.

4 Remove the right hinge cover.

5 When removing the left hinge cover, use a small screwdriver as shown to release the latch from the rear base cover. Pull the hinge cover slightly upward to keep it unlatched.

6 From the front side, remove the latch with a small screwdriver as shown to remove the cover. **Be careful not to scratch the surface of the computer when you use a screwdriver to remove the latches.**

7 Remove the four screws.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	LCD ground-terminal (1)	4 mm
3	LCD hinge cover, right (1)	4 mm
7	LCD hinge (4)	4 mm

Note: Make sure you use the correct screw.

Safety Notice 5: Translation on page 11

If the LCD breaks and the fluid from inside the LCD gets into your eyes or on your hands, immediately wash the affected areas with water for at least 15 minutes. Seek medical care if any symptoms from the fluid are present after washing.

Caring for the LCD

- When cleaning of the LCD becomes necessary, gently wipe the LCD with a dry, soft cloth. Do not use alcohol or detergent to clean the LCD.
- To avoid damaging the LCD, do not scratch or apply any force to its surface.
- Do not put anything on the surface of the LCD.

2080 Speaker Shield Assembly

- Battery Pack (2020)
- Diskette Drive (2030)
- Hard Disk Drive (2035)
- Keyboard Unit (2040)
- Status Indicator (2060)
- LCD Assembly (2070)

Models 750x, 755C, and 755Cs

Model 370C

Important:

1. Carefully remove any metal particles that might have flaked off.
2. The shaded part in the figure is attached to the speaker shield assembly with light adhesive. This FRU is a separate FRU from the speaker shield assembly.

- 1** Remove the screws.
- 2** Gently raise the speaker shield assembly to avoid damaging the speaker cable and make sure that the shield assembly does not hook the three flexible cables of the keyboard.
- 3** Disconnect the speaker connector.

When Disconnecting the Connector

- Do not pull the speaker cable before the audio card is removed.
- Be careful not to damage the speaker with screwdrivers, screws, or other objects. A scratch will damage the speaker.
- When replacing the speaker shield, insert it under the projection at the left, rear corner of the computer base.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1a	Speaker shield (4)	4 mm
1b	Hard disk drive connector (2)	6 mm
1c	System board (1)	16 mm
1d	System board, spacer (1)	16 mm
1e	Diskette drive connector (2)	6 mm

Note: Make sure you use the correct screw.

Notes:

1. **1d** shows the correct position of the spacer.
2. **2** is a shield for radio frequency interference.

2085 Audio Card

Note: Refer to “Product Overview” on page 232 to see whether the audio card is standard or not.

- Battery Pack (2020)
- Diskette Drive (2030)
- Hard Disk Drive (2035)
- Keyboard Unit (2040)
- Status Indicator (2060)
- LCD Assembly (2070)
- Speaker Shield Assembly(2080)

2090 Interposer Card

- Battery Pack (2020)
- Diskette Drive (2030)
- Hard Disk Drive (2035)
- Keyboard Unit (2040)
- Status Indicator (2060)
- LCD Assembly (2070)
- Speaker Shield Assembly (2080)
- Audio Card (2085)

2100 DC/DC Card

- Battery Pack (2020)
- Diskette Drive (2030)
- Hard Disk Drive (2035)
- Keyboard Unit (2040)
- Status Indicator (2060)
- LCD Assembly (2070)
- Speaker Shield Assembly (2080)
- Audio Card (2085)
- Interposer Card (2090)

Notes:

1. When replacing the DC/DC card, put the spacer **5** on the screw hole.
2. DC-in holder **A** and spacer **5** are supplied as miscellaneous parts.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
3	Power jack (1)	8 mm (flat head)
Note: Make sure you use the correct screw.		

2110 Backup Battery

2105 Standby Battery

- Battery Pack (2020)
- Diskette Drive (2030)

Model 750x

- 2** Standby Battery
- 3** Backup Battery

Models 370C, 755C, and 755Cs

- 3** Standby Battery
- 4** Backup Battery

Note: When replacing the batteries, make sure the batteries are seated correctly. Make sure the insulator cover **1** is in the correct position by sliding it end to end.

Step	Location (Quantity)	Length
1	cover (1)	4 mm

Note: Make sure you use the correct screw.

Safety Notice 2: Translation on page 8

The standby battery contains a small amount of nickel and cadmium. Do not disassemble it, recharge it, throw it into fire or water, or short-circuit it. Dispose of the battery as required by local ordinances or regulations.

Safety Notice 4: Translation on page 10

The backup battery is a lithium battery and can cause a fire, explosion, or severe burn. Do not recharge it, remove its polarized connector, disassemble it, heat it above 100°C (212°F), incinerate it, or expose its cell contents to water. Dispose of the battery as required by local ordinances or regulations. Use of an incorrect battery can result in ignition or explosion of the battery. Replacement batteries can be ordered from IBM or IBM Authorized Dealers.

2120 System Board Assembly

- Battery Pack (2020)
- Diskette Drive (2030)
- Hard Disk Drive (2035)
- Keyboard Unit (2040)
- Status Indicator (2060)
- LCD Assembly (2070)
- Speaker Shield Assembly (2080)
- Audio Card (2085)
- Interposer Card (2090)
- DC/DC Card (2100)
- Backup Battery (2110)
- Standby Battery (2105)

Important

The EEPROM on the system board contains the vital product data (VPD), that is, system unit serial number, system board serial number, and other computer unique data. When the system board is replaced, the system unit serial number must also be restored. Use the **Set system identification** utility on the maintenance diskette to restore the number.

Do not power-off the computer when restoring the VPD.

The serial number label is attached to the bottom cover.

Notes:

1. For Model 755C, there are two types the system boards. Make sure the correct system board by checking the part number in the part list. After replacing the system board, run the display test from the Easy-Setup and use the **Pause** button to check the color graduations that are displayed after the **Video Page** screen. If the color blocks in one column are all the same color, replace the system board.
2. Before removing and replacing the system board, make sure that the PCMCIA cards are removed and the eject levers are not sticking out.
3. When replacing the system board assembly, align the power-key slide hub with the power-switch actuator by moving the power-key in the direction of the arrow. See the large circle in the figure. Before tightening any screws, check that the power-switch operates correctly.
4. Do not pull the PCMCIA slot assembly while removing the system board.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	Hinge bracket (4)	4 mm
2	Base cover, lower shield (1)	4 mm
Note: Make sure you use the correct screw.		

2130 PCMCIA Slot Assembly

- Battery Pack (2020)
- Diskette Drive (2030)
- Hard Disk Drive (2035)
- Keyboard Unit (2040)
- Status Indicator (2060)
- LCD Assembly (2070)
- Speaker Shield Assembly (2080)
- Audio Card (2085)
- Interposer Card (2090)
- DC/DC Card (2100)
- Backup Battery (2110)
- Standby Battery (2105)
- System Board Assembly (2120)

Notes:

1. When handling the PCMCIA slot assembly, be careful not to disassemble any part of it. The slot assembly is not solidly fixed when it is removed from the system board or the FRU.
In step **4**, gently pull up the bottom of the center area of the connector board edge with your fingers.
2. The screw stand located each corner of the PCMCIA slot, is easy to remove. Make sure that the screw stand is located when replace the slot. Do not replace the slot without the screw stand.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	PCMCIA slot, upper (2)	12 mm
2	PCMCIA slot, lower (2)	14 mm

Note: Make sure you use the correct screw.

2140 Processor Card (750Ce, 755C, 755Cs)

- Battery Pack (2020)
- Diskette Drive (2030)
- Hard Disk Drive (2035)
- Keyboard Unit (2040)
- Status Indicator (2060)
- LCD Assembly (2070)
- Speaker Shield Assembly (2080)
- Audio Card (2085)
- Interposer Card (2090)
- DC/DC Card (2100)
- Backup Battery (2110)
- Standby Battery (2105)
- System Board Assembly (2120)
- PCMCIA Slot Assembly (2130)

Warning: The system board can be damaged if the lower shield touches the system board components. Carefully follow the next instruction.

In step **3**, gradually raise the system board from the lower shield until all components of the system board just clear the tabs of the lower shield. Be careful not to raise it too far. While keeping the clearance to a minimum, separate the system board from the lower shield by moving the system board straight forward as shown by step **3**.

Note: In step **1**, each screw has a flat washer and a lock washer. When reinstalling the screws, make sure that the lock washer is placed next to the head of the screw. Incorrect washer placement can cause metal to flake.

Turn the system board upside down. Remove the screws **4** and **5**. Models 370C, 755C and 755Cs have only the screw on the right side in step **5**.

Notes:

1. In step **1**, use 5.0 mm and 5.5 mm hex head screwdrivers. To remove the processor card, gently lift the area shown by **3** straight up. Do not pull the other areas.
2. In step **6**, pull both edges of the bracket at the same time. Do not pull the center of the bracket.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	Expansion bus, lower shield (2)	Hex head
1	I/O connector, lower shield (6)	Hex head
4	Processor card (1)	6 mm
5	Processor card connector 750x - (2), 370C, 755C, 755Cs - (1)	4 mm
Note: Make sure you use the correct screw.		

Locations

System - Front View (750, 750Cx, 755Cx, 370C, 360x, 355x)

- 1** LCD
- 2** Contrast Control

Note: The Model 360 does not have a contrast control. The Model 755C has one of two types of LCD: one with a contrast control and one without.

- 3** Brightness Control
- 4** Status Indicator
See "Status Indicators" on page 228.
- 5** External Input Device Connector
- 6** PCMCIA Slot
- 7** PCMCIA Release Lever
- 8** Keyboard
- 9** LCD and Keyboard Latch
- 10** TrackPoint II
- 11** Click Button
- 12** Diskette-Eject Button
- 13** Diskette Drive
- 14** Fn Key

System Rear View - All Models

- 1** Diskette Drive Cover
- 2** Power Switch
- 3** Microphone/Line-In Jack
- 4** Headphone Jack

Note: Not all models have jacks **3** and **4**.

- 5** Power Jack
- 6** Serial Connector
- 7** Parallel Connector
- 8** External Display Connector
- 9** Reset Pushbutton
- 10** System Expansion Connector

Note: Model 355x does not have this connector.

A multimedia portable expansion unit, port replicator, or port replicator with PCMCIA can be connected to this interface to support the following features.

- 16-bit AT-bus interface
- Serial port
- Parallel port
- Keyboard and mouse
- HDD connection
- LED control signals
- Visual signals
- Audio signals
- FDD signals
- PCMCIA signals
- Power controls
- Power line

General Checkout

Use the following procedure as a guide for computer problems. The diagnostic tests are intended to test only IBM products. Non-IBM products, prototype cards, or modified options can give false errors and invalid system responses.

1. Obtain the failing symptoms in as much detail as possible.
2. Verify the symptoms by attempting to recreate the failure by running the diagnostic test or by repeating the same operation.

Note: To run the diagnostics, refer to “How to Run the Diagnostics” on page 345.

3. Use the following table with the verified symptom to determine which page to go to. Search the symptoms column and find the description that best matches your symptom; then go to the page shown in the “Go to” column.

Symptom	Go to
Power failure. (The power indicator does not go on or stay on.)	“Power Systems Checkout” on page 322.
POST does not complete. No beeps or error codes are indicated.	“Symptom-to-FRU Index” on page 331, and then use the No Beep Symptoms table.
POST beeps, but no error codes are displayed.	“Symptom-to-FRU Index” on page 331, and then use the Beep Symptoms table.
POST detected an error and displayed numeric error codes.	“Symptom-to-FRU Index” on page 331, and then use the Numeric Error Codes table.
The diagnostic test detected an error and displayed an FRU code.	“FRU Codes” on page 334.
The configuration is not the same as the installed devices.	“Checking the Installed Devices List” on page 346.
Other symptoms (such as LCD display problems).	“Symptom-to-FRU Index” on page 331, and then use the other symptom table.
Symptoms cannot be recreated. (Intermittent problems.)	Use the customer reported symptoms and go to “Symptom-to-FRU Index” on page 331.

Memory Checkout

One of two types of memory cards can be used, IC DRAM card or DIMM card. See the following table for the total memory size available when they are installed.

IC DRAM	Displayed Value
0MB	7808KB
2MB	9856KB
4MB	11904KB
8MB	16000KB
16MB	24192KB

DIMM	Displayed Value
0MB	7808KB
4MB	11904KB
8MB	16000KB
12MB	20096KB
16MB	24192KB
20MB	28288KB
24MB	32384KB
32MB	40576KB

Memory errors might stop system operations, show error messages on the screen, or hang the system. The computer detects memory parity errors but does not correct them.

Use the following procedure to isolate memory problems.

1. Check whether or not the memory card use parity or non-parity.

Note: Installing a non-parity memory card causes parity errors when parity checking is enabled. If the non-parity memory card is installed, disable the parity check through the Easy-Setup configuration screen.
2. Make sure that the memory card is fully seated in the connector. A loose connection can cause an error.
3. Power-off the computer and remove the IC DRAM card, or DIMM card from its slot (if installed).
4. Press and hold the F1 key; then power-on the computer. Hold the F1 key down until the Easy-Setup screen appears.
5. Select **Test** and press enter.
6. Select **Memory** and press enter to run the memory test on base memory. If an error appears, replace the memory card.
7. Power-off the computer and reinstall the IC DRAM card or DIMM card; then power-on the computer. Verify the memory size; then test the memory. If an error appears, replace the IC DRAM card or the DIMM card.

If memory problems occur intermittently, use the loop option to repeat the test. When the test detects an error,

an error log is printed on the printer connected to the parallel port. See "Error Log" on page 346 for more information.

System Programs in Flash Memory: System setup programs and diagnostic tests are stored in flash memory.

Flash Memory Update: A flash memory update is required for the following conditions:

- New versions of system programs.
- New feature or options are added.

When Updating Flash Memory

Do not power-off the computer, disconnect the Vac power, or remove the battery during the Flash update. The system board will have to be replaced if the update is interrupted.

Updating Flash memory also resets all of the customer's configuration settings to the default values.

To update the Flash memory, perform the following steps:

1. Get the appropriate diskette which contains the update.
2. Insert the **System Program Service Diskette** into drive A and power-on the computer.
3. Select **Update system programs** from the menu.

System Board and Processor Card Checkout

The processing functions are performed by both the system board and the processor card. Processor problems can be caused by either FRU. However, the processor card generally has a lower probability of failure. When a numeric code calls the system board or the processor card as a FRU, or the processor card is called by a diagnostic test by showing FRU code 11, use the following procedure to isolate the problem.

1. Run the system board test to verify the symptom. This test verifies both the system board and the processor card. If no error is detected, return to "General Checkout" on page 317.
2. If FRU code 10 appears, replace the system board but do not replace the processor card. Transfer the processor card from the old system board to the new system board.
3. If FRU code 11 appears, reseal the processor card.
4. Rerun the test to verify the fix.
5. If FRU code 11 remains, replace the processor card.

If above procedure does not correct the problem, go to "Undetermined Problems" on page 343.

Keyboard/Auxiliary Input Device Checkout

Remove the external keyboard if the internal keyboard is to be tested.

If the internal keyboard does not work or an unexpected character appears, make sure that the three flexible cables extending from the keyboard are correctly seated in the connectors on the interposer card.

If the keyboard cable connection is correct, run the **Keyboard Test** by doing the following:

1. Go to diagnostic menu screen by pressing **Ctrl+A** in the Easy-Setup screen.
2. Press **Ctrl+K**; a layout of the keyboard appears on the screen.
3. Check that when each key is pressed, the key position on the keyboard layout on the screen changes to a black square.

Note: When a Fn key is pressed, a black square briefly appears.

If the tests detect a keyboard problem, do the following one at a time to correct the problem. Do not replace a non-defective FRU.

- Reseat the three cables.
- Replace the keyboard.
- Replace the Video Card Assembly.
- Replace the system board.

The following auxiliary input devices are supported for this computer.

- Numeric keypad
- Mouse (PS/2 compatible)
- External keyboard (with keyboard/mouse cable)

If any of the above devices do not work, reseat the cable connector and repeat the failing operation.

If the problem does not occur again, recheck the connector.

If the problem is not corrected, replace the device, and then the system board.

TrackPoint III Checkout

If the TrackPoint III will not work, check the configuration in the Easy-Setup by selecting **Keyboard** from the **Config** menu. If the configuration of the TrackPoint III is disabled, select **Enable** to enable it.

If this does not correct the TrackPoint III problem, continue with the following.

The TrackPoint III does automatic compensations to adjust the pointer sensor. During this process, the pointer moves

on the screen automatically for a short time. This self-acting pointer movement can occur when a slight, steady pressure is applied to the TrackPoint III pointer while the computer is powered on or while the system is running, or re-adjustment is required because the temperature has exceeded its normal temperature range. This symptom does not indicate a hardware problem. No service actions are necessary if the pointer movement stops in a short period of time.

If a click button problem or pointing stick problem occurs, do the following:

1. Go to the Easy-Setup screen.
2. Select an item with the pointing stick.
3. Press either the left or right click button.
4. Verify that both buttons work correctly.

If either the pointing stick or the click button will not work, do the following actions one at a time to correct the problem. Do not replace a non-defective FRU.

- Reseat the three keyboard cables.
- Replace the keyboard.
- Replace the interposer card.
- Replace the system board.

Game Port Checkout

Do the following if a joystick problem occurs.

1. Connect the Joystick to the Game Port.
2. Go to the Easy-Setup screen.
3. Select an item with the Joystick.
4. Press any button of the Joystick.
5. Verify all buttons work correctly.

If either the Joystick or button does not work, replace the system board.

Diskette Drive Test

Do the following to isolate the problem to a controller, drive, or diskette. A scratch, write enabled, non-defective 2HD diskette is required.

Warning: Make sure that the diskette does not have more than one label attached to it. Multiple labels can cause damage to the drive or can cause the drive to fail.

Do the following to select the test device:

1. Select the advanced diagnostic mode and select **Tool**; then select the icon **FDD-1** or **FDD-2** and press the space key. A ✓ mark appears next to the selected icon. Insert the **blank** diskette when instructed.
2. Run the diskette drive test.
3. If the controller test detects an error, FRU code 10 appears. Replace the system board.

4. If the controller test runs without errors, the drive read/write tests start automatically.
5. If the drive test detects an error, FRU code 50 for FDD-1 or 51 for FDD-2 appears. If the diskette itself is known to be good, replace the drive.
6. If the drive is attached through a Port Replicator as FDD-1 or FDD-2 and the test detects errors, move the drive to the computer's diskette drive connector directly, and test it again as FDD-1.

If no errors occur at the FDD-1 position, the drive is not defective. Go to "Port Replicator Checkout" in "Common Devices Checkout" section to isolate the replicator problem.

7. If the drive is attached through an Expansion Unit, go to the service manual of the Expansion Unit to isolate the problem.
8. If the drive is attached through a Diskette Drive Attachment Unit, replace the unit.

Power Systems Checkout

To verify the symptom of the problem, power-on the computer using each of the power sources as follows.

1. Remove the battery pack, diskette drive, and hard disk drive.
2. Connect the AC Adapter and check that power is supplied.
3. Install the diskette drive, or hard disk drive one at a time and check that power is supplied from each power source.
4. Disconnect the AC Adapter, remove the hard disk and diskette drive, and install the charged battery pack; then check that power is supplied by battery pack.

If you suspect a power problem, see the appropriate power supply check listed below.

- "Checking the AC Adapter."
- "Checking Operational Charging" on page 323.
- "Checking the Battery Pack" on page 324.
- "Checking the Car-Battery Adapter" on page 326.
- "Checking the Backup Battery" on page 326.
- "Checking the Standby Battery" on page 327.
- "Port Replicator Power Overload" on page 330.

Checking the AC Adapter: You are here because the computer fails only when the AC Adapter is used.

- If the power problem occurs only when the port replicator is used, replace the replicator.
- If the power-on indicator does not turn on, check the power cord of the AC Adapter for correct continuity and installation.

- If the operational charge does not work, go to “Checking Operational Charging” on page 323.

Note: There are several types of adapters. The procedure for checking both types is the same.

1. Unplug the AC Adapter cable from the computer and measure the output voltage at the plug of the AC Adapter cable. See the following figure.

AC Adapter (40W)

Pin	Voltage (V dc)
1	+18.0 to +21.0
2	Ground

AC Adapter (35W)

Pin	Voltage (V dc)
1	+16.0 +1.0/-0.5
2	Ground

- If the voltage is correct, replace the system board. If the problem is not corrected, go to “Undetermined Problems” on page 343.
 - If the voltage is not correct, go to the next step.
2. Unplug the AC Adapter cable from the ac power outlet and wait five minutes or longer to allow the over voltage protection circuit to be fully discharged and initialized.
 3. Plug the AC Adapter cable into the ac power outlet.
 4. Measure the output voltage of the AC Adapter.
 5. If the voltage is still not correct, replace the AC Adapter.

Note: An audible noise from the AC Adapter does not always indicate a defective adapter.

Checking Operational Charging: To check operational charging, use a discharged battery pack or a battery pack that shows a yellow or orange battery status indicator when it installed in the computer.

Perform operational charging. If the battery status indicator turns orange and the battery charging indicator turns green within two minutes, replace the AC Adapter.

Checking the Battery Pack: Battery charging will not start until the Fuel-Gauge shows that less than 90% of the total power remains; with this condition the battery pack will charge to 100% of its capacity. This protects the battery pack from being over-charged or having a shortened life.

Before you do the following steps, check the following:

- The correct battery pack is used for the model.
 - The storage switch set to on (I).
1. Power-off the computer.
 2. Remove the battery pack and measure the voltage between battery terminals 1 (+) and 4 (-). See the following figure.

Ni-MH Battery Pack

Terminal	Voltage (V dc) / Signal
1	+8.0 to +16.0
2	Send
3	Thermal
4	Ground (-)
5	NC
6	NC
7	NC

Li-ion Battery Pack

Note: Li-ion battery is optional for Model 755CDV.

Terminal	Voltage (V dc) / Signal
1	+8.0 to +13.0
2	Send
3	Thermal
4	Ground (-)
5	R1

Note: Signal lines, not used in these steps, are used for communication between the system and the battery. The storage switch is used to control the power to the internal microprocessor of the battery. The storage switch should be set to off (0) only when the battery is going to be kept in storage for more than two months.

- If the voltage is less than +8.0 V dc, the battery pack has been discharged or is defective. Recharge the battery. If the recharging does not work, go to Step 5 to check the charging circuit.

If the voltage is still less than +8.0 V dc after the recharging, replace the battery.

- If the voltage is more than +8.0 V dc, measure the resistance between battery terminals 3 and 4. The resistance must be 4 to 30 K ohm.

If the resistance is not correct, replace the battery pack.

If the resistance is correct, replace the DC/DC card.

- To check the charging circuit, do the following. Plug in the AC Adapter with the battery pack removed, then power-on the computer.
- Measure the charging voltage between DC/DC terminals 1 (+) and 4 (-).
- If the voltage is less than +9.0 V dc, replace the DC/DC card. If the voltage is more than +9.0 V dc, the charging circuit is working correctly, replace the battery pack.

Checking the Car-Battery Adapter

Note: There are several types of adapters but the checkout procedure is the same for both of them.

1. Unplug the Car-Battery Adapter cable from the computer.
2. Plug the Car-Battery Adapter into the cigarette lighter socket.

Note: If the adapter is already plugged in, reseal it.

3. Measure the output voltage of the Car-Battery Adapter cable. See the following figure.

Pin	Voltage (V dc)
1	+19.0 to +21.0
2, 3	Ground

- If the voltage is correct and the power-on indicator on the Car-Battery Adapter is on all the time, the Car-Battery is working correctly. Replace the system board.

If the problem is not resolved when the system board is replaced, go to “Undetermined Problems” on page 343.

- If the voltage is outside the normal voltage range, do one of the following:
 - Try the above test procedures in a different car, if one is available.
 - Replace the Car-Battery Adapter if the computer works correctly with the AC Adapter.

Note: If the output voltage from the cigarette lighter socket of the car is less than 10.5 V dc, a continuous noise can be heard. The condition of the car battery should be checked by appropriate service personal.

Checking the Backup Battery

1. Power-off the computer and unplug the AC Adapter from the computer.
2. Open the keyboard, and remove the battery pack.
3. Remove the backup battery from the shield assembly.
4. Measure the voltage of the backup battery. See the following figure.

Wire	Voltage (V dc)
Red	+2.5 to +3.7
Black	Ground

- If the voltage is correct, replace the system board.
- If the voltage is not correct, the backup battery has been discharged. Replace the backup battery.
- If the backup battery discharges quickly after replacement, replace the system board.

Checking the Standby Battery

1. Power-off the computer and unplug the AC Adapter from the computer.
2. Open the keyboard, and remove the battery pack and the diskette drive.
3. Remove the standby battery. (Refer to "2100 Standby Battery and Front IR" on page 363 to remove the battery.)
4. Measure the voltage of the standby battery.
 - If the voltage between red and black is 3.5 V dc or greater, the voltage is correct. Go to Step 10 on page 328 to verify standby battery operation.
 - If the voltage is less than 3.5 V dc, go to the next step.
5. Plug the AC Adapter into the computer and power-on the computer.
6. Measure the output voltage at the connector on the system board.

Pin	Voltage (V dc)
+	+4.0
-	Ground

- If the voltage is less than +4.0 V dc, replace the DC/DC card. If the voltage is still low, replace the system board.
 - If the voltage is more than +4.0 V dc, power-off the computer, replace the standby battery, and go to the next step.
7. Ensure that the AC Adapter is plugged into the computer; then power-on the computer.
 8. Charging of the standby battery starts. A depleted battery needs approximately 30 minutes to be recharged to the operational voltage of +3.5 V dc.
 9. Unplug the AC Adapter.
 10. Verify the standby battery function by removing and installing the battery pack during suspend mode.

Note: Removing and installing the battery pack during suspend mode should be done within one minute. The resume operation must start. If the resume operation does not work, switching of power from the battery pack to standby battery will not be correct. Replace the DC/DC card.

If replacing the DC/DC card does not resolve the problem, replace the system board.

Power Management Features

Three power management modes are provided by the computer to save power consumption and prolong battery power.

Standby Mode: When in standby mode the following occurs:

- The LCD backlight turns off.
- The hard disk motor stops.
- The CPU clock is set to the lowest speed.

Events that cause entering of standby mode:

- Standby requested by the Fn key. (Fn+F3)
- No activity under **auto-standby** enabled by the feature utility.

Events that cause exiting or resuming of standby mode:

- (Resume) Any key operation.

Suspend Mode: When the computer enters the suspend mode, the following occurs:

- The LCD backlight turns off.
- The LCD power is powered-off.
- The hard disk is powered-off.
- The CPU clock is set to the lowest speed.
- The CPU is stopped.
- In the ThinkPad Features Program, the computer can be set to "Will not suspend even if LCD is closed."
- When the computer is powered with ac power and is used with one of the following IBM PC cards, the computer will only enter the *standby mode*. The PC card and application program remain active.
 - 3270 Emulation Credit Card Adapter
 - 5250 Emulation Credit Card Adapter
 - Token-Ring 16/4 Credit Card Adapter
 - Credit Card Adapter for Ethernet

The following conditions prevent the computer from entering the suspend mode.

- While the communication link is running.
- When a serial mouse or external pointing device has been selected in the **Config** menu of the Easy-Setup.

Events that cause the computer to enter the suspend mode:

- Suspend mode is requested by the Fn key (Fn+F4).
- The LCD is closed.
- The keyboard is opened.
- The specified time has elapsed from the last operation with the keyboard, mouse, hard disk drive, parallel connector, diskette drive, or the AC Adapter is plugged in. The time is specified by **Suspend Timer** in the ThinkPad Features program.
- The battery condition is low. The battery power indicator blinks (orange).
- *The PS2 OFF* command is set in the ThinkPad Features program.

Events that cause exiting or resuming of the suspend mode:

- (Resume) The LCD is opened.
- (Resume) The keyboard is closed.
- (Resume) Real time clock alarm signaled.
- (Resume) Ring indicator (RI) signaled by serial or PCMCIA device.
- (Resume) The Fn key is pressed.
- (Exit) Timer conditions are satisfied to enter hibernation mode.

Hibernation Mode: When in hibernation mode, the following occurs:

- The system status, RAM, VRAM, and setup data are stored on the hard disk.
- The system is powered-off.

Events that prevent the computer from entering the hibernation mode.

- A serial mouse or external pointing device has been selected in the **Config** menu of the Easy-Setup.
- The computer is powered with ac power and one of the following IBM PC cards is used.
 - PCMCIA Data/FAX Modem
 - High Speed PCMCIA Data/FAX Modem
 - 3270 Emulation Credit Card Adapter
 - 5250 Emulation Credit Card Adapter
 - Token-Ring 16/4 Credit Card Adapter
 - Credit Card Adapter for Ethernet

Events that cause the computer to enter the hibernation mode.

- Pressing the Fn key (Fn+F12).
- Timer conditions are satisfied in suspend mode.
- Critical low battery condition.

Event that causes the computer to exit the hibernation mode.

- The power-on switch is operated.

When power is turned on, the hibernation history of the boot record on the hard disk is recognized and system status is restored from the hard disk to resume operation.

Port Replicator Power Overload: If intermittent power shut-downs occur while using PCMCIA-2 devices through a port replicator, suspect an over-current problem. Some PCMCIA devices use too much power, and if the maximum usage of each device occurs simultaneously, the total current could exceed the replicator limit, thereby causing a power shut down. Remove each device one at a time and repeat the sequence until problem fails to return. Then determine the cause.

Symptom-to-FRU Index

The Symptom-to-FRU Index lists the symptoms and errors and the possible causes. The most likely cause is listed first.

Perform the FRU replacement or actions in the sequence shown in the “FRU/Action” columns. If a FRU did not solve the problem, put the original part back in the computer. Do not replace a non-defective FRU.

This index can also be used to help you decide which FRUs to have available when servicing a computer.

Numeric error codes show the errors detected in POST or system operation. In the following error codes, **X** can be any number.

If no codes are available, use narrative symptoms.

If the symptom is not listed, go to “Undetermined Problems” on page 343.

Note: For IBM devices not supported by diagnostic codes of the ThinkPad computers, see the manual for that device.

Numeric Error Codes

Symptom/Error	FRU/Action
10X	1. System Board
110	1. Go to “Memory Checkout” on page 317. 2. IC DRAM Card or DIMM Card 3. System Board
111	1. Go to “Memory Checkout” on page 317. 2. Expansion Unit/Port Replicator 3. System Board
158 (HDP was not set even though the supervisor password is set.)	1. Set a HDP.
159 (HDP is not set the same as the supervisor password.)	1. Set a correct HDP.
161	1. Go to “Checking the Backup Battery” on page 326. 2. Backup Battery 3. System Board

Symptom/Error	FRU/Action
163 (Time and Date was not set.)	<ol style="list-style-type: none"> Set Time and Date. System Board

I9990301 I9990302 I9990305	<ol style="list-style-type: none"> Reseat the boot device. Check the startup sequence for the correct boot device. Check that operating system has no failure, or is installed correctly.
I9990303	<ol style="list-style-type: none"> System Board
Other codes not listed above	<ol style="list-style-type: none"> Go to "Undetermined Problems" on page 343.

FRU Codes

If an error is detected by the diagnostic tests, a *four-digit* FRU code is displayed. The FRU code indicates two suspected FRUs. Replace the FRU that is indicated by the *two leftmost digits* first, then replace the FRU indicated by the *two rightmost digits*. No FRU is assigned to code 00. If only one FRU is suspected, the other FRU code is filled with zeros. See the referenced page before replacing the FRU.

FRU Code	FRU/Action
10	System Board
11	Processor Card
16	DSP Card
17	Front IR unit
18	Rear IR unit
20	Memory (See "Memory Checkout" on page 317.)
30	Reserved
32	External Keyboard
33	External Mouse
40	LCD Assembly
41	Video Card
45	External CRT
50	<ol style="list-style-type: none"> Reseat the Drive (FDD-1) Diskette Drive (FDD-1)

FRU Code	FRU/Action
51	<ol style="list-style-type: none"> 1. Reseat the Drive (FDD-2) 2. Diskette Drive (FDD-2)
60	<ol style="list-style-type: none"> 1. Reseat the Hard Disk Drive (HDD-1) 2. Hard Disk Drive (HDD-1)
61	<ol style="list-style-type: none"> 1. Reseat the Hard Disk Drive (HDD-2) 2. Hard Disk Drive (HDD-2)
70	PCMCIA-2 (Replicator)
71	PCMCIA (under CD-ROM drive)
80	Cellular Modem
90	CD-ROM Drive

Note: The device ID and error codes are used to indicate the detail portion of the FRU which caused the error. If replacing a FRU does not correct a problem, see the Device ID or error code from the previous failure. If they have changed, the cause might be because the new FRU is defective or that the FRU was incorrectly installed.

If the problem remains after replacement of the FRUs, go to “Undetermined Problems” on page 343.

Beep Symptoms

Symptom/Error	FRU/Action
Continuous beeps.	System Board
One beep and a blank, unreadable, or flashing LCD.	<ol style="list-style-type: none"> 1. Reseat all LCD connectors. 2. LCD Assembly 3. Video Card 4. System Board 5. DC/DC Card
One beep, and the message “Unable to access boot source.”	<ol style="list-style-type: none"> 1. Boot device 2. System Board
One long, two short beeps and a blank or unreadable LCD.	<ol style="list-style-type: none"> 1. System Board 2. Video Card 3. LCD Assembly
One long beep followed by four short beeps each time the power switch is operated. (System cannot power-on due to low battery voltage.)	Connect the AC Adapter or install a fully-charged battery.
One beep every second. (System is shutting down due to low battery voltage.)	Connect the AC Adapter or install a fully-charged battery (allows system to complete shutdown before changing the battery).
Two short beeps with error codes.	POST error. See “Numeric Error Codes” on page 331.

Symptom/Error	FRU/Action
Two short beeps with blank screen.	System Board

No Beep Symptoms

Symptom/Error	FRU/Action
No beep, power-on indicator not on, and a blank LCD during POST.	<ol style="list-style-type: none"> 1. Go to “Power Systems Checkout” on page 322. 2. System Board 3. DC/DC Card 4. Power sources
No beep, power-on indicator on, and a blank LCD during POST.	<ol style="list-style-type: none"> 1. System Board 2. DC/DC Card 3. Processor Card
No beep, power-on indicator on, and a blinking cursor only during POST.	<ol style="list-style-type: none"> 1. System Board 2. Processor Card 3. DC/DC Card
No beep during POST but system runs correctly.	<ol style="list-style-type: none"> 1. Turn the volume up and check the speaker 2. Speaker 3. DSP Card 4. DC/DC Card

LCD Related Symptoms

The TFT LCD for the notebook computer contains over 921 000 thin film transistors (TFTs). A small number of missing, discolored or lighted dots (on all the time) is characteristic of TFT LCD technology, but excessive pixel problems can cause viewing concerns.

Before Replacing the LCD

The LCD should not be replaced unless the number of dots satisfies the following condition:

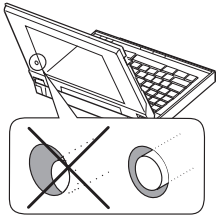

- The number of missing or discolored, or lighted dots in any colored background is 21 or more.

Note: For Model 755CDV, see also “Model 755CDV Symptoms” on page 337 for LCD related symptoms.

Symptom/Error	FRU/Action
No beep, power-on indicator on, and a blank LCD during POST.	<ol style="list-style-type: none"> 1. System Board 2. DC/DC Card 3. Video Card 4. Processor Card

Symptom/Error	FRU/Action
<ul style="list-style-type: none"> • LCD backlight not working, or • LCD too dark, or • LCD brightness cannot be adjusted, or • LCD contrast cannot be adjusted. 	<ol style="list-style-type: none"> 1. Reseat the LCD connectors. 2. LCD Assembly 3. Interposer Card 4. DC/DC Card
<ul style="list-style-type: none"> • LCD screen unreadable, or • Characters missing pels, or • Screen abnormal, or • Wrong color displayed. 	<ol style="list-style-type: none"> 1. See the preceding note on replacing LCDs. 2. Reseat all LCD connectors. 3. LCD Assembly 4. System Board 5. Video Card 6. Interposer Card
LCD has extra horizontal or vertical lines displayed.	LCD Assembly

Model 755CDV Symptoms

Symptom/Error	FRU/Action
The screen is black when the LCD cover is installed.	<ol style="list-style-type: none"> 1. Verify that the LCD cover is firmly installed on the LCD. 2. Diagnose the LCD assembly by following "LCD Related Symptoms" on page 336.
The LCD is wavy when the computer is placed on the overhead projector.	Some overhead projectors interfere with the LCD of the computer. Use another overhead projector.
The LCD stays on even when the LCD cover is removed.	<p>Make sure that the switch on the rear of the LCD is not stuck. If it is stuck, release it with the tip of a ball-point pen.</p> 

Symptom/Error	FRU/Action
<ul style="list-style-type: none"> • Abnormal screen • Uneven color on the screen • Spot on the screen 	<ol style="list-style-type: none"> 1. Check that the white film on the LCD cover is clean. Gently wipe the film with a dry, soft cloth, such as a lens cleaner. 2. LCD Cover 3. Diagnose the LCD assembly by following "LCD Related Symptoms" on page 336. <p>Note: The customer may be responsible for repair costs if the LCD cover was damaged due to misuse, excessive force, scratch, or liquid spilled by the customer.</p>
<p>The computer has an intermittent problem when you use it on the overhead projector.</p>	<p>Problem such as high environmental temperature might be the cause. Use the stand supplied with the computer.</p>
<p>The remote control does not work.</p>	<ol style="list-style-type: none"> 1. Check that two AAA alkaline batteries are installed in the remote control. 2. Check that two AAA alkaline batteries in the remote control are at their normal energy (voltage) level. 3. Enable the IR port of the computer with the ThinkPad Features program. (Disable the serial port at this time.) 4. Refer to the trouble shooting section in the Help menu of the Mind Path Presentation F/X program. Set up this program following the guide. 5. If the preceding items are correct, the radiation from the light of the overhead projector might be interfering the IR port of the computer. Disable the rear IR port of the computer, and use the remote control with the front IR port. 6. Use the remote control with another computer, which IR port works normally. If the remote control does not work, the remote control is not working properly. <p>If there is still a problem, refer to "Infrared Related Symptoms" on page 342.</p>

Keyboard/TrackPoint III Related Symptoms

Symptom/Error	FRU/Action
Keyboard (one or more keys) does not work.	<ol style="list-style-type: none"> 1. Reseat the three keyboard cables. 2. Keyboard 3. Video Card 4. System Board
TrackPoint III does not work.	<ol style="list-style-type: none"> 1. Go to “TrackPoint III Checkout” on page 320. 2. Keyboard 3. Video Card 4. System Board
Pointer moves automatically or does not work correctly.	<ol style="list-style-type: none"> 1. See “TrackPoint III Checkout” on page 320.

Indicator Related Symptoms

Symptom/Error	FRU/Action
Indicator incorrectly remains off or on, but system runs correctly.	<ol style="list-style-type: none"> 1. Reseat the status indicator cable. 2. Status Indicator 3. Interposer Card 4. System Board
Battery power status indicator blinks from green, yellow, to orange.	<ol style="list-style-type: none"> 1. Check that a correct battery is installed. 2. Set the battery storage switch to ON. 3. Battery Pack 4. DC/DC Card 5. System Board

Power Related Symptoms

Symptom/Error	FRU/Action
Power shut down during operation.	<ol style="list-style-type: none"> 1. Go to “Power Systems Checkout” on page 322. 2. Battery Pack 3. Remove the battery pack and let it cool for two hours. 4. DC/DC Card 5. Power sources
The system will not power-off. (See “Reset Pushbutton” on page 346.)	<ol style="list-style-type: none"> 1. Press the Reset pushbutton. 2. System Board

Function/Audio Related Symptoms

Symptom/Error	FRU/Action
The system will not suspend or resume by opening or closing the keyboard.	<ol style="list-style-type: none"> 1. Go to “Suspend Mode” on page 329 and check that the computer can enter suspend mode. 2. DC/DC Card 3. Video Card 4. System Board
The system will not suspend or resume by opening or closing the LCD.	<ol style="list-style-type: none"> 1. Go to “Suspend Mode” on page 329 and that check that the computer can enter suspend mode. 2. Top Cover 3. DC/DC Card 4. System Board
Battery Fuel-Gauge does not go higher than 90%.	Go to “Checking the Battery Pack” on page 324 and see the note.
Memory count (size) appears differently from actual size.	Go to “Memory Checkout” on page 317.
System configuration does not match the installed devices.	Go to “Checking the Installed Devices List” on page 346.
System hangs intermittently.	Go to “Intermittent Problems” on page 342.

Peripheral Device Related Symptoms

Symptom/Error	FRU/Action
External display does not work correctly.	1. See "External Display Self-Test" in "Common Devices Checkout" section.
Printer problems.	1. Run Printer Self-test. 2. Parallel Port Device 3. Cable 4. System Board
Serial or parallel port device problems.	1. Device 2. Device Cable 3. System Board

Other Symptoms

Symptom/Error	FRU/Action
Errors occur only when Port Replicator is used.	See "Port Replicator Checkout" in "Common Devices Checkout" section.
PCMCIA slot pin is damaged.	PCMCIA Slots Assembly

Note: If you cannot find a symptom or error in this list and the problem remains, see "Undetermined Problems" on page 343.

Infrared Related Symptoms

Symptom/Error	FRU/Action
Unable to communicate using the Infrared (IR) Port	<ol style="list-style-type: none">1. Make sure the setup for the IR is correct.2. Make sure there are no fluorescent lights near the computer. The computer may receive electrical noise from the fluorescent light.3. Run the advanced diagnostic test. If an error occurs and a FRU code is displayed, replace the parts shown by the FRU code.4. For Model 755CDV, if the remote control is enabled, the communication with the IR port is disabled. Run the Mind Path Presentation F/X program and set the infrared to OFF; then observe the symptom.

Intermittent Problems

Intermittent system hang problems can be caused by a variety of reasons that have nothing to do with a hardware defect such as: cosmic radiation, electrostatic discharge, or software errors. FRUs replacement should only be considered when a recurring problems exists.

When analyzing the intermittent problem, do the following:

1. Run the advanced diagnostic test for the system board in loop mode at least 10 times.
2. If no error is detected, do **not** replace any FRUs.
3. If any error is detected, replace the FRU shown by the FRU code. Rerun the test to verify that no more errors exist.

Undetermined Problems

You are here because the diagnostic tests did not identify which adapter or device failed, installed devices are incorrect, a short circuit is suspected, or the system is inoperative. Follow the procedures below to isolate the failing FRU (do not isolate non-defective FRUs).

Verify that all attached devices are supported by the computers.

Verify that the power supply being used at the time of the failure is operating correctly. (See "Power Systems Checkout" on page 322.)

1. Power-off the computer.
2. Check the cables, wires, and connectors for short circuits and open circuits. Visually check them for damage. If any problems are found, replace the FRU.
3. Remove or disconnect all of the following devices.
 - a. Non-IBM devices
 - b. Devices attached to the expansion bus connector
 - c. Printer, mouse, and other external devices
 - d. Battery pack
 - e. Hard disk drive
 - f. Diskette drive or the device attached to the diskette drive connector
 - g. IC DRAM card or DIMM card
 - h. PC Cards

Note: Remember that removing the hard disk drive, an IC DRAM card, or any adapter or device, might cause configuration errors. Ignore error code 174.

4. Power-on the computer.
5. Determine if the problem has changed.
6. If the problem does not occur again, reconnect the removed devices one at a time until you find the failing FRU.
7. If the problem remains, replace the following FRUs one at a time. Do not replace a non-defective FRU.
 - DC/DC card
 - Interposer card
 - LCD assembly
 - System board
 - Processor card

Related Service Procedures

This section provides information about the following:

- “Status Indicators”
- “How to Run the Diagnostics” on page 345
- “Error Log” on page 346
- “Reset Pushbutton” on page 346
- “Checking the Installed Devices List” on page 346
- “Password Combinations (POP, HDP, PAP)” on page 347
- “How to Run the Low Level Format” on page 347
- “PC Test Card LED” on page 347
- “Fn Key Combinations” on page 348
- “How To Run the Keyboard Diagnostics” on page 348

Status Indicators

The system status indicators show the current computer status in different colors (green, yellow, and orange).

Symbol	Color	Meaning
	Blinking green	Speaker sounds
	Green	Battery fully charged
	Yellow	Battery usable
	Orange	Battery low, or if  is green, the operational charge cannot be performed.
	Blinking orange	Battery almost depleted
	Blinking green, yellow, and orange	Battery storage switch is set off
	Orange, or Green, or Yellow	if  is blinking twice every 3 seconds, the battery is discharging.
	Green	Battery charging
	Orange	PC card in-use
	Orange	Diskette drive in-use
	Orange	Hard disk drive in-use
	Green	Keys in Num Lock mode

Symbol	Color	Meaning
	Green	Keys in Caps Lock mode
	Green	Keys in Scroll Lock mode
	Green	Computer in suspend mode
	Blinking green	Computer resuming normal mode
	Green	Computer powered on

How to Run the Diagnostics

Use either the TrackPoint III or the cursor move keys to interact with the tests. The Enter key works the same as selecting the OK icon to reply OK.

1. Press and hold the F1 key; then power-on the computer. Hold the F1 key down until Easy-setup screen appears.
2. Select **Test** and press Enter.
3. Select a device and press Enter to run the test. To test the Infrared Port, click the "SystemBoard" icon.
4. The test progress screen appears.
5. **OK** appears when the test ends without any errors.
6. Start the **Advanced Diagnostic test** by pressing **Ctrl+A** on the basic diagnostic menu screen.
7. Select **Tool** to install the tools.
8. Select a device, press the **space** key, and install the tool. Multiple devices can be selected by repeating this step.
A √ mark appears for the selected device.
9. Select **OK** and press Enter if the selection is OK.
10. Select a device and press Enter to start the tests.
11. Select **Test All** to test all devices.
12. Select **Loop Test** to loop tests.
A loop option menu appears in which a device loop or all loop can be selected. Select a device and press the **space** key to select a device. Repeat this step to select multiple devices. Press Enter to start the diagnostic loop. If no device is selected, all device tests are looped.
13. To exit the loop, keep pressing **Ctrl+Pause** until the test exits. A beep sounds to notify that the exit interrupt is sensed by the test program.

Error Log

Diagnostic errors are printed on the printer that is attached to the parallel port when the error is detected. The error is also logged in the system memory.

Do the following to display the errors.

1. End the test, if it is running.
2. Press **Ctrl+A** to select the advanced diagnostic mode.
3. Press **Ctrl+E**.
4. The error log appears.
5. To exit the screen, select the cancel icon or press Esc.

The error log is not saved when system power is powered-off.

Reset Pushbutton

The reset pushbutton resets the system and forces the power to be powered-off. Use this pushbutton when the power is not completely off or the system is hung. See "Rear View" on page 382 for the location of the pushbutton.

Checking the Installed Devices List

If a device is installed but the icon appears in a gray shade rather than a dark shade on the basic diagnostics screen, the device is defective. Reseat the device connectors. If the symptom remains, replace the device or the system board. If needed, adjust the contrast control to clearly distinguish the shades of the icon.

If a device that is not installed appears in a dark shade, for example, FDD-2 appears in a dark shade when *NO* second FDD is installed, do the following.

1. Replace the **first** device, such as a FDD-1, HDD-1, or PCMCIA-1.
2. If the problem remains, replace the system board.

PCMCIA-1, Parallel, and Serial icons are always displayed in dark shade, because the icons represent subsystems of the system board and not attachment of the devices.

The HDD-1, FDD-1, or PCMCIA-1 represents the **first** drive in the system configuration, respectively. Similarly, the HDD-2, FDD-2, or PCMCIA-2 represents the **second** drive, usually attached through a port replicator or an expansion unit.

Password Combinations (POP, HDP, PAP)

The password relationship is:

- **When POP is the same as HDP**
The POP prompt appears, but the HDP prompt does not appear.
- **When POP is not the same as HDP**
Both POP and HDP prompts appear.
- **PAP and HDP**
When PAP is used, the HDP is enabled automatically, but no HDP prompt appears. The HDP is set the same as PAP.

How to Run the Low Level Format

Do the following to format the hard disk.

Warning: Make sure the drive address to be formatted is correct. This procedure will erase all information on the disk.

1. Power-off the computer.
2. Insert the **ThinkPad 755Ce hardware maintenance diskette** into diskette drive **A** and power-on the computer.
Note: You can use this maintenance diskette for all models.
3. Select **Format the hard disk** from the main menu.
4. Select the drive from the menu.
5. Follow the instructions on the screen.

PC Test Card LED

The green LED on the PC test card turns on when the PCMCIA test is running. If the LED does not turn on, check that the card is installed correctly by reseating the card. If it still does not turn on after it is reseated, try using another slot for the test. If the LED still does not turn on and the test fails, replace the FRU shown in the diagnostic error code.

Fn Key Combinations

The following table shows the **Fn** key and function key combinations and their corresponding functions.

The Fn key works independently from the operating system. The operating system obtains the status through the system management interface to control the system.

Fn +	Description
F1	Reserved
F2	Fuel-gauge display ON/OFF
F3	Standby mode invocation
F4	Suspend mode invocation
F5	Reserved
F6	Reserved
F7	LCD/CRT display switching
F8	Reserved
F9	Reserved
F10	Reserved
F11	Power management mode switching (Toggles High power, Intelligent, Economy)
F12	Hibernation invocation

How To Run the Keyboard Diagnostics

Do the following to run the keyboard test.

1. Go to the advanced diagnostic screen menu by pressing **Ctrl+A** in Easy-Setup menu.
2. Go to the keyboard diagnostic test menu by pressing **Ctrl+K**.
3. Check that when each key is pressed, the key position on the keyboard layout on the screen changes to a black square.

Note: When a Fn key is pressed, a black square briefly appears.

Product Overview

The following table shows an overview of the system features.

Feature	Description
Processor	Intel 486DX4 100/33 MHz
Bus Architecture	<ul style="list-style-type: none">• AT Bus• VESA Local Bus for video subsystem
Memory (Standard)	8MB (on the system board)
Memory (Option)	<ul style="list-style-type: none">• 2, 4, 8, 16MB, Basic IC DRAM card (max. 16 MB)• 4, 8, 16MB, DIMM card (max. 40 MB)• DIMM card adapter
CMOS RAM	128 Bytes
VGA Video	10.4-inch, 64K color, TFT LCD color
Diskette Drive (Removable)	<ul style="list-style-type: none">• 0.720, 1.2, 1.44, 2.88MB (4-mode), 3.5-inch• 0.720, 1.44, (2-mode), 3.5-inch
Hard Disk Drive (Removable)	<ul style="list-style-type: none">• 340MB, 2.5-inch• 540MB, 2.5-inch• 810MB, 2.5-inch
Super Video Card	<ul style="list-style-type: none">• Video accelerator• Video capture/overlay• Video composite In/Out
CD-ROM	<ul style="list-style-type: none">• 5-inch• Double speed• IDE interface
DSP Card	<ul style="list-style-type: none">• Microphone jack• Headphone jack• Modem port
IR	Two infra-red ports
PCMCIA	One Type-III or two Type-II

FRU Removals and Replacements

This section contains information about removals and replacements.

- An electrostatic discharge (ESD) strap must be used to establish personal grounding.
The system board is sensitive to, and can be damaged by, electrostatic discharge. Establish personal grounding by touching a ground point with one hand before touching these units.
- The arrows in the “Removals and Replacements” section show the direction of movement to remove a FRU, or to turn a screw to release the FRU. The arrows are marked in numeric order, in square callouts, to show the correct sequence of removal.
- When other FRUs must be removed before removing the failing FRU, they are listed at the top of the page.
- To replace a FRU, reverse the removal procedure and follow any notes that pertain to replacement. See “Locations” for internal cable connections and arrangement information.
- When replacing a FRU, use the correct screw size as shown in the procedures.

— **Safety Notice 8: Translation on page 13** —

Before removing any FRU, power-off the computer, unplug all power cords from electrical outlets, remove the battery pack, and then disconnect any interconnecting cables.

— **Safety Notice 3: Translation on page 9** —

The battery pack contains small amounts of nickel. Do not disassemble it, throw it into fire or water, or short-circuit it. Dispose of the battery pack as required by local ordinances or regulations.

— **Safety Notice 1: Translation on page 7** —

Before the computer is powered-on after FRU replacement, make sure all screws, springs, or other small parts, are in place and are not left loose inside the computer. Verify this by shaking the computer and listening for rattling sounds. Metallic parts or metal flakes can cause electrical short circuits.

2010 Rear Connector Door

Remove the center latch **1**; then remove the rear connector door by flexing it **2**.

2015 Foot

To replace the foot:

- Align the foot in the open position with one pivot in its hinge in the base cover
- Press the other pivot point into position with your thumb or finger

2020 Battery Pack

- CD-ROM Drive (2030)

Notes:

1. Be careful that the computer does not fall backward when the battery pack is removed.
2. When replacing the battery pack, check that the storage switch of the new battery is set to the on (I) position. Do not operate the storage switch of a battery that has been used and is going to be re-used.
3. Check that the keyboard latch springs are in place.

2030 CD-ROM/Diskette Drive

Note: Remove the CD-ROM/Diskette drive exactly as shown in the figure. Do not apply any extra force to the CD-ROM/Diskette drive when removing it.

Warning: When replacing the CD-ROM/diskette drive, check that the standby battery is seated correctly to prevent damage to the drive.

2040 Hard Disk Drive

- CD-ROM Drive (2030)
- Battery Pack (2020)

Warning: Do not drop or apply any shock to the hard disk drive. The hard disk drive is sensitive to physical shock. Incorrect handling can cause damage it, and cause permanent loss of data on the hard disk. Before removing the hard disk drive, have the user make a backup copy of all the information on the hard disk. Never remove the hard disk drive while the system is operating or is in suspend mode.

Note: Remove the hard disk drive exactly as shown in the figure. Do not apply any extra force to the hard disk drive when removing it.

Warning: After replacing the hard disk drive, latch the removal strap into the correct position.

2050 IC DRAM Card or DIMM Adapter

- CD-ROM Drive (2030)
- Battery Pack (2020)

Note: One of the following combinations occupies the slot depending on the configuration.

- IC DRAM card + IC DRAM card base
- DIMMs on DIMM adapter

If the IC DRAM Card is installed:

Warning: The IC DRAM card is sensitive to physical shock. Incorrect handling of the card can damage it. The eject tape (P/N 53G9318) must be used to remove the card.

If the DIMM Adapter is installed:

Press both locks at the same time and remove the DIMM.

While holding the strap **A**, pull the DIMM adapter toward the front to remove it.

Notes:

1. If the IC DRAM cards or the DIMM are not installed and the base plate is installed instead of these cards, remove the plate as follows:
 - a. Pinch the projection **A** on the left side of the plate; then pull the plate slightly toward the front.
 - b. Raise the rear portion of the plate and remove it.

2. When inserting the DIMM into either connector on the DIMM adapter:
 - a. Locate the triangle **A** on the right side of the socket.
 - b. With the notched end of the DIMM **B** toward the triangle, insert the DIMM into the socket.
 - c. Pivot the DIMM until it snaps into place.

If you have another DIMM to install, insert it in the other socket the same way.

2060 Keyboard Spacer

2080 Keyboard Unit

- CD-ROM Drive (2030)
- Battery Pack (2020)

Loosen the three screws **2** and **3**, and push **4** to release the five top cover latches at the rear side of the system unit.

When removing the screw covers **1**, use a small screwdriver.

The keyboard unit is connected to the system board with flexible cables. Remove the upper cover; then disconnect the cables to remove the keyboard unit as shown.

To remove the top cover, do not latch the keyboard. Lower the keyboard and remove the top cover.

Warning: Do not pull the keyboard cables. The keyboard cables will be damaged if the keyboard is disconnected without releasing the three latches **7**.

Notes:

1. When replacing the keyboard, check that the three cables are clean, and inserted straight and fully into the connectors. Slide both ends of each latch at the same time to make sure that each cable is correctly inserted. Go to “Keyboard/Auxiliary Input Device Checkout” on page 320 and test all keys before returning the computer to the customer.
2. When replacing the top cover, insert the four latches at the rear side of the cover into the foot guide of the the LCD; push the right, left, and front sides to snap it into place.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
2	Top cover (1)	14 mm
3	Top cover (2)	4 mm
6	Top cover (1)	4 mm

Note: Make sure you use the correct screw.

2090 Status Indicator

- CD-ROM Drive (2030)
- Battery Pack (2020)
- Keyboard Unit (2080)

Warning: Do not pull the status indicator cable. The cable will be damaged if the status indicator is disconnected without releasing the latch in step 2.

Note: When replacing the indicator, insert the flexible cable straight into the connector until the head of the cable stops. Slide both ends of the latches at the same time to make sure that the cable is correctly inserted.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	LED Stand off (2)	14 mm
Note: Make sure you use the correct screw.		

2100 Standby Battery and Front IR

- CD-ROM Drive (2030)
- Battery Pack (2020)

Where: **A** is the IR Cable. **B** is the Standby Battery Cable. **C** is the IR Lens.

Note: When replacing the battery, make sure the battery are seated correctly. Make sure the IR lens **2** is in the correct position by sliding it end to end.

Step	Location (Quantity)	Length
1	cover (1)	4 mm

Note: Make sure you use the correct screw.

Safety Notice 2: Translation on page 8

The standby battery contains a small amount of nickel and cadmium. Do not disassemble it, recharge it, throw it into fire or water, or short-circuit it. Dispose of the battery as required by local ordinances or regulations.

2110 Backup Battery

- CD-ROM Drive (2030)
- Battery Pack (2020)

Safety Notice 4: Translation on page 10

The backup battery is a lithium battery and can cause a fire, explosion, or severe burn. Do not recharge it, remove its polarized connector, disassemble it, heat it above 100°C (212°F), incinerate it, or expose its cell contents to water. Dispose of the battery as required by local ordinances or regulations. Use of an incorrect battery can result in ignition or explosion of the battery. Replacement batteries can be ordered from IBM or IBM Authorized Dealers.

2115 Logic Assembly

- CD-ROM Drive (2030)
- Battery Pack (2020)
- Hard Disk Drive (2040)
- Keyboard Unit (2080)
- Status Indicator (2090)
- Standby Battery and Front IR (2100)
- Backup Battery (2110)

The screw **1** is located at the rear bottom side.

See next page.

Note: When replacing the logic assembly, align the power-key slide hub with the power-switch actuator by moving the power-key in the direction of the arrow. See the large circle in the figure. Before tightening any screws, check that the power-switch operates correctly.

Step	Location (Quantity)	Length
1	Logic assembly (1)	4 mm
4	Logic assembly (4)	8 mm
Note: Make sure you use the correct screw.		

2120 Shield Assembly

- CD-ROM Drive (2030)
- Battery Pack (2020)
- Hard Disk Drive (2040)
- Keyboard Unit (2080)
- Status Indicator (2090)
- Standby Battery and Front IR (2100)
- Backup Battery (2110)
- Logic Assembly (2115)

Step	Location (Quantity)	Length
1	Shield assembly (3)	4 mm
2	Shield assembly (3)	14 mm
3	Shield assembly (1)	8 mm
Note: Make sure you use the correct screw.		

2125 Video Card or Rear IR

- CD-ROM Drive (2030)
- Battery Pack (2020)
- Hard Disk Drive (2040)
- Keyboard Unit (2080)
- Status Indicator (2090)
- Backup Battery (2110)
- Standby Battery and Front IR (2100)
- Logic Assembly (2115)
- Shield Assembly (2120)

The connector is located under **A**.

Do **4** and **5** after step **3** to remove the rear IR.

2130 DC/DC Card

- CD-ROM Drive (2030)
- Battery Pack (2020)
- Hard Disk Drive (2040)
- Keyboard Unit (2080)
- Status Indicator (2090)
- Backup Battery (2110)
- Standby Battery and Front IR (2100)
- Logic Assembly (2115)
- Shield Assembly (2120)
- Video Card or Rear IR (2125)

2140 DSP Card

- CD-ROM Drive (2030)
- Battery Pack (2020)
- Hard Disk Drive (2040)
- Keyboard Unit (2080)
- Status Indicator (2090)
- Backup Battery (2110)
- Standby Battery and Front IR (2100)
- Logic Assembly (2115)
- Shield Assembly (2120)
- Video Card or Rear IR (2125)
- DC-DC Card (2130)

Remove the following:

- Mini-Jack Holder
- Modem Guide
- Modem Lever
- Microphone Cable

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	DSP card (1)	8 mm
2	DSP card (1)	14 mm

Note: Make sure you use the correct screw.

2150 Interposer Card

- CD-ROM Drive (2030)
- Battery Pack (2020)
- Hard Disk Drive (2040)
- Keyboard Unit (2080)
- Status Indicator (2090)
- Backup Battery (2110)
- Standby Battery and Front IR (2100)
- Logic Assembly (2115)
- Shield Assembly (2120)
- Video Card or Rear IR (2125)
- DC-DC Card (2130)
- DSP Card (2140)

2160 System Board Assembly

- CD-ROM Drive (2030)
- Battery Pack (2020)
- Hard Disk Drive (2040)
- Keyboard Unit (2080)
- Status Indicator (2090)
- Backup Battery (2110)
- Standby Battery and Front IR (2100)
- Logic Assembly (2115)
- Shield Assembly (2120)
- Video Card or Rear IR (2125)
- DC/DC Card (2130)
- DSP Card (2140)
- Interposer Card (2150)
- Processor Card (2180)

Notes:

1. Before removing and replacing the system board, make sure that the PCMCIA cards are removed and the eject levers are not sticking out.
2. When replacing the system board assembly, align the power-key slide hub with the power-switch actuator by moving the power-key in the direction of the arrow. See the large circle in the figure. Before tightening any screws, check that the power-switch operates correctly.
3. Do not pull the PCMCIA slot assembly while removing the system board.

2170 PCMCIA Slot Assembly

- CD-ROM Drive (2030)
- Battery Pack (2020)
- Hard Disk Drive (2040)
- Keyboard Unit (2080)
- Status Indicator (2090)
- Backup Battery (2110)
- Standby Battery and Front IR (2100)
- Logic Assembly (2115)
- Shield Assembly (2120)
- Video Card or Rear IR (2125)
- DC/DC Card (2130)
- DSP Card (2140)
- Interposer Card (2150)
- Processor Card (2180)

Notes:

1. When handling the PCMCIA slot assembly, be careful not to disassemble any part of it. The slot assembly is not solidly fixed when it is removed from the system board or the FRU.
In step **3**, gently pull up the bottom of the center area of the connector board edge with your fingers.
2. The screw stand at each corner of the PCMCIA slot is

easy to remove. Make sure that the screw stand is correctly positioned when the slot is replaced. Do not replace the slot without the screw stand.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	PCMCIA slot, upper (2)	4 mm
2	PCMCIA slot, lower (2)	14 mm
Note: Make sure you use the correct screw.		

2180 Processor Card

- CD-ROM Drive (2030)
- Battery Pack (2020)
- Hard Disk Drive (2040)
- Keyboard Unit (2080)
- Status Indicator (2090)
- Backup Battery (2110)
- Standby Battery and Front IR (2100)
- Logic Assembly (2115)

Turn the system board upside down. Then remove any metal tape holding the card.

To remove the processor card, gently lift the area shown by **A** straight up. Do not pull the other areas.

Note: If the processor card is not installed correctly, the computer may not turn on. Reinstall the card in this case.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	Processor card assembly	14 mm
Note: Make sure you use the correct screw.		

2190 LCD Assembly

- CD-ROM Drive (2030)
- Battery Pack (2020)
- Keyboard Unit (2080)
- Status Indicator (2090)

Note: When removing the LCD cables **1**, pull the connector straight up. Incorrect handling can damage the connector.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
3	LCD hinge (4)	4 mm
Note: Make sure you use the correct screw.		

Safety Notice 5: Translation on page 11

If the LCD breaks and the fluid from inside the LCD gets into your eyes or on your hands, immediately wash the affected areas with water for at least 15 minutes. Seek medical care if any symptoms from the fluid are present after washing.

To Clean the LCD

Gently wipe the LCD with a dry, soft cloth. Do not use alcohol or detergent to clean the LCD.

To avoid damaging the LCD, do not scratch or apply any force to its surface.

2195 LCD Rear Cover (755CDV only)

Slightly push out and release the latches **1**.

Note: Do not touch the film **2** on the rear cover while the cover is removed from the LCD.

2200 Lower Shield Assembly

- CD-ROM Drive (2030)
- Battery Pack (2020)
- Hard Disk Drive (2040)
- Keyboard Unit (2080)
- Status Indicator (2090)
- Backup Battery (2110)
- Standby Battery and Front IR (2100)
- Logic Assembly (2115)
- Shield Assembly (2120)
- Video Card or Rear IR (2125)
- DC/DC Card (2130)
- DSP Card (2140)
- Interposer Card (2150)
- Processor Card (2180)
- System Board Assembly (2160)

2210 Memory Card

- CD-ROM Drive (2030)
- Battery Pack (2020)
- Hard Disk Drive (2040)
- Keyboard Unit (2080)
- Status Indicator (2090)
- Backup Battery (2110)
- Standby Battery and Front IR (2100)
- Logic Assembly (2115)
- Shield Assembly (2120)
- Video Card or Rear IR (2125)
- DC/DC Card (2130)
- DSP Card (2140)
- Interposer Card (2150)
- Processor Card (2180)
- System Board Assembly (2160)
- Lower Shield Assembly (2200)

Note: If the computer does not complete POST after changing the memory card, reseal the card and try again.

Locations

Front View

- 1** LCD
- 2** Built-in Microphone
- 3** Brightness Control
- 4** Status Indicator
 - See "Status Indicators" on page 344.
- 5** External Input Device Connector
- 6** Video-In Port
- 7** Video-Out Port
- 8** PCMCIA Slot
- 9** Keyboard
- 10** LCD and Keyboard Latch
- 11** Click Button
- 12** CD-ROM Drive
- 13** Front Infrared Port
- 14** Fn Key
- 15** TrackPoint III
- 16** Volume Knob
- 17** Built-in Speaker

Rear View

- 1** Telephony Jack
- 2** Microphone/Line-In Jack
- 3** Headphone Jack
- 4** Power Switch
- 5** Power Jack
- 6** Serial Connector
- 7** Parallel Connector
- 8** External-Display Connector
- 9** Reset Switch
- 10** Game Port
- 11** System Expansion Connector

A multimedia portable expansion unit, port replicator, or port replicator with PCMCIA can be connected to this interface to support the following features.

- 16-bit AT-bus interface
- Serial port
- Parallel port
- Keyboard and mouse
- HDD connection
- LED control signals
- Visual signals
- Audio signals
- FDD signals
- PCMCIA signals
- Power controls
- Power line

- 12** Rear Infrared Port

General Checkout

Use the following procedure as a guide for computer problems.

Note: The diagnostic tests are intended to test only IBM products. Non-IBM products, prototype cards or modified options can give false errors and invalid system responses.

1. Obtain the failing symptoms in as much detail as possible.
2. Verify the symptoms by attempting to recreate the failure by running the diagnostic test or by repeating the same operation.

Note: To run the diagnostics, refer to “How to Run the Diagnostics” on page 421.

3. Use the following table with the verified symptom to determine which page to go to. Search the symptoms column and find the description that best matches your symptom; then go to the page shown in the “Go to” column.

Symptom	Go to
Power failure. (The power indicator does not go on or stay on.)	“Power Systems Checkout” on page 398.
POST does not complete. No beeps or error codes are indicated.	“Symptom-to-FRU Index” on page 408, and then use the No Beep Symptoms table.
POST beeps, but no error codes are displayed.	“Symptom-to-FRU Index” on page 408, and then use the Beep Symptoms table.
POST detected an error and displayed numeric error codes.	“Symptom-to-FRU Index” on page 408, and then use the Numeric Error Codes table.
The diagnostic test detected an error and displayed an FRU code.	“FRU Codes” on page 411.
The configuration is not the same as the installed devices.	“Checking the Installed Devices List” on page 422.
Other symptoms (such as LCD display problems).	“Symptom-to-FRU Index” on page 408, and then use the other symptoms table.
Symptoms cannot be recreated (intermittent problems).	Use the customer reported symptoms and go to “Symptom-to-FRU Index” on page 408.

Memory Checkout

One of two types of memory cards can be used, IC DRAM card or DIMM card. See the following table for the total memory size available when they are installed.

IC DRAM	Displayed Value
0 MB	7808 KB
2 MB	9856 KB
4 MB	11904 KB
8 MB	16000 KB
16 MB	24192 KB

DIMM	Displayed Value
0 MB	7808 KB
4 MB	11904 KB
8 MB	16000 KB
12 MB	20096 KB
16 MB	24192 KB
20 MB	28288 KB
24 MB	32384 KB
32 MB	40576 KB

Memory errors can stop system operations, show error messages on the screen, or hang the system. The computer detects memory parity errors but does not correct them.

Use the following procedure to isolate memory problems.

Notes:

- a. Except Model 755CX, installing a non-parity memory card causes memory errors. Before you go to the next procedure, check whether or not the memory card use parity or non-parity. If the non-parity memory card is installed, disable the parity check on the Easy-Setup configuration screen.
 - b. Make sure that the memory card is fully installed into the connector. A loose connection can cause an error.
1. Power-off the computer and remove the IC DRAM card, or DIMM card from its slot (if installed).
 2. Press and hold the F1 key; then power-on the computer. Hold the F1 key down until the Easy-Setup screen appears.
 3. Select **Test** and press enter.
 4. Select **Memory** and press enter to run the memory test on base memory. If an error appears, replace the memory card.
 5. Power-off the computer and reinstall the IC DRAM card or the DIMM card; then power-on the computer. Verify the memory size; then test the memory. If an error appears, replace the IC DRAM card or the DIMM card.

If memory problems occur intermittently, use the loop option to repeat the test. When the test detects an error, an error log is printed on the printer connected to the parallel port. See "Error Log" on page 421 for more information.

System Programs in Flash Memory: System setup programs and diagnostic tests are stored in Flash memory.

Flash Memory Update: A flash memory update is required for the following conditions:

- New versions of system programs.
- New feature or options are added.

When Updating Flash Memory

Do not power-off the computer, disconnect the Vac power, or remove the battery during the Flash update. The system board will have to be replaced if the update is interrupted.

Updating Flash memory also resets all of the customer's configuration settings to the default values.

To update the Flash memory, perform the following steps:

1. Get the appropriate diskette which contains the update.
2. Insert the **System Program Service Diskette** into drive A and power-on the computer.
3. Select **Update system programs** from the menu.

System Board and Processor Card Checkout

The processing functions are performed by both the system board and the processor card. Processor problems can be caused by either FRU. However, the processor card generally has a lower probability of failure. When a numeric code calls the system board or the processor card as a FRU, or the processor card is called by a diagnostic test by showing FRU code 11, use the following procedure to isolate the problem.

1. Run the system board test to verify the symptom. This test verifies both the system board and the processor card. If no error is detected, return to "General Checkout" on page 393.
2. If FRU code 10 appears, replace the system board but do not replace the processor card. Transfer the processor card from the old system board to the new system board.
3. If FRU code 11 appears, reseal the processor card.
4. Rerun the test to verify the fix.
5. If FRU code 11 remains, replace the processor card.

If above procedure does not correct the problem, go to “Undetermined Problems” on page 419.

Keyboard/Auxiliary Input Device Checkout

Remove the external keyboard if the internal keyboard is to be tested.

If the internal keyboard does not work or an unexpected character appears, make sure that the three flexible cables extending from the keyboard are correctly seated in the connectors on the interposer card.

If the keyboard cable connection is correct, run the **Keyboard Test** by doing the following:

1. Go to diagnostic menu screen by pressing **Ctrl+A** in the Easy-Setup screen.
2. Press **Ctrl+K**; a layout of the keyboard appears on the screen.
3. Check that when each key is pressed, the key position on the keyboard layout on the screen changes to a black square.

Note: When a Fn key is pressed, a black square briefly appears.

If the tests detect a keyboard problem, do the following one at a time to correct the problem. Do not replace a non-defective FRU.

- Reseat the three cables.
- Replace the keyboard.
- Replace the interposer card.
- Replace the system board.

The following auxiliary input devices are supported for this computer.

- Numeric keypad
- Mouse (PS/2 compatible)
- External keyboard (with keyboard/mouse cable)

If any of the above devices do not work, reseat the cable connector and repeat the failing operation.

If the problem does not occur again, recheck the connector.

If the problem is not corrected, replace the device, and then the system board.

TrackPoint III Checkout

If the TrackPoint III will not work, check the configuration in the Easy-Setup by selecting **Keyboard** from the **Config** menu. If the configuration of the TrackPoint III is disabled, select **Enable** to enable it.

If this does not correct the TrackPoint III problem, continue with the following.

The TrackPoint III does automatic compensations to adjust the pointer sensor. During this process, the pointer moves on the screen automatically for a short time. This self-acting pointer movement can occur when a slight, steady pressure is applied to the TrackPoint III pointer while the computer is powered on or while the system is running, or re-adjustment is required because the temperature has exceeded its normal temperature range. This symptom does not indicate a hardware problem. No service actions are necessary if the pointer movement stops in a short period of time.

If a click button problem or pointing stick problem occurs, do the following:

1. Go to the Easy-Setup screen.
2. Select an item with the pointing stick.
3. Press either the left or right click button.
4. Verify that both buttons work correctly.

If either the pointing stick or the click button will not work, do the following actions one at a time to correct the problem. Do not replace a non-defective FRU.

- Reseat the three keyboard cables.
- Replace the keyboard.
- Replace the interposer card.
- Replace the system board.

Diskette Drive Test

Do the following to isolate the problem to a controller, drive, or diskette. A scratch, write enabled, non-defective 2HD diskette is required.

Note: Make sure that the diskette does not have more than one label attached to it. Multiple labels can cause damage to the drive or can cause the drive to fail.

Do the following to select the test device:

1. Select the advanced diagnostic mode and select **Tool**, then select the icon **FDD-1** or **FDD-2** and press the space key. A ✓ mark appears next to the selected icon. Insert the **blank** diskette when instructed.
2. Run the diskette drive test.
3. If the controller test detects an error, FRU code 10 appears. Replace the system board.
4. If the controller test runs without errors, the drive read/write tests start automatically.
5. If the drive test detects an error, FRU code 50 for FDD-1 or 51 for FDD-2 appears. If the diskette itself is known to be good, replace the drive.
6. If the drive is attached through a Port Replicator as FDD-1 or FDD-2 and the test detects errors, move

the drive to the computer's diskette drive connector directly, and test it again as FDD-1.

If no errors occur at the FDD-1 position, the drive is not defective. Go to "Port Replicator Checkout" in "Common Devices Checkout" section to isolate the replicator problem.

7. If the drive is attached through an Expansion Unit, go to the service manual of the Expansion Unit to isolate the problem.
8. If the drive is attached through a Diskette Drive Attachment Unit, replace the unit.

Power Systems Checkout

To verify the symptom of the problem, power-on the computer using each of the power sources as follows.

1. Remove the battery pack, diskette drive, and hard disk drive.
2. Connect the AC Adapter and check that power is supplied.
3. Install the diskette drive, or hard disk drive one at a time and check that power is supplied from each power source.
4. Disconnect the AC Adapter, remove the hard disk and diskette drive, and install the charged battery pack; then check that power is supplied by battery pack.

If you suspect a power problem, see the appropriate power supply check listed below.

- "Checking the AC Adapter."
- "Checking Operational Charging" on page 399.
- "Checking the Battery Pack" on page 399.
- "Checking the Car-Battery Adapter" on page 402.
- "Checking the Travel Quick Charger" on page 403.
- "Checking the Backup Battery" on page 403.
- "Checking the Standby Battery" on page 403.
- "Port Replicator Power Overload" on page 407.

Checking the AC Adapter: You are here because the computer fails only when the AC Adapter is used.

- If the power problem occurs only when the port replicator is used, replace the replicator.
- If the power-on indicator does not turn on, check the power cord of the AC Adapter for correct continuity and installation.
- If the operational charge does not work, go to "Checking Operational Charging" on page 399.

Note: There are several types of adapters. The procedure for checking both types is the same.

1. Unplug the AC adapter cable from the computer and measure the output voltage at the plug of the AC adapter cable. See the following figure.

AC adapter (40W)

Pin	Voltage (V dc)
1	+18.0 to +21.0
2	Ground

AC adapter (35W)

Pin	Voltage (V dc)
1	+16.0 to +1.0/-0.5
2	Ground

- If the voltage is correct, replace the system board. If the problem is not corrected, go to “Undetermined Problems” on page 419.
 - If the voltage is not correct, go to the next step.
2. Unplug the AC Adapter cable from the ac power outlet and wait five minutes or longer to allow the over voltage protection circuit to be fully discharged and initialized.
 3. Plug the AC Adapter cable into the ac power outlet.
 4. Measure the output voltage of the AC Adapter.
 5. If the voltage is still not correct, replace the AC Adapter.

Note: An audible noise from the AC Adapter does not always indicate a defective adapter.

Checking Operational Charging: To check operational charging, use a discharged battery pack or a battery pack that shows a yellow or orange battery status indicator when it installed in the computer.

Perform operational charging. If the battery status indicator turns orange and the battery charging indicator turns green within two minutes, replace the AC Adapter.

Checking the Battery Pack: Battery charging will not start until the Fuel-Gauge shows that less than 90% of the total power remains; with this condition the battery pack will charge to 100% of its capacity. This protects the battery pack from being over-charged or having a shortened life.

Before you do the following steps, check the following:

- The correct battery pack is used for the model.
 - The storage switch set to on (I).
1. Power-off the computer.

- Remove the battery pack and measure the voltage between battery terminals 1 (+) and 4 (-). See the following figure.

Ni-MH Battery Pack

Terminal	Voltage (V dc) / Signal
1	+8.0 to +16.0
2	Send
3	Thermal
4	Ground (-)
5	NC
6	NC
7	NC

Li-Ion Battery Pack

Note: Li-ion battery is optional for Model 755CV and standard for Model 755CX.

Terminal	Voltage (V dc) / Signal
1	+8.0 to +13.0
2	Send
3	Thermal
4	Ground (-)
5	Select (+)

Note: Signal lines, not used in these steps, are used for communication between the system and the battery. The storage switch is used to control the power to the internal microprocessor of the battery. The storage switch should be set to off (0) only when the battery is going to be kept in storage for more than two months.

3. If the voltage is less than +8.0 V dc, the battery pack has been discharged or is defective. Recharge the battery. If the recharging does not work, go to Step 5 to check the charging circuit.

If the voltage is still less than +8.0 V dc after the recharging, replace the battery.

4. If the voltage is more than +8.0 V dc, measure the resistance between battery terminals 3 and 4. The resistance must be 4 to 30 K ohm.

If the resistance is not correct, replace the battery pack.

If the resistance is correct, replace the DC/DC card.

5. To check the charging circuit, do the following.

Note: Be careful not to cause a short circuit. Plug in the AC Adapter with the battery pack removed, then power-on the computer.

6. Measure the charging voltage between DC/DC terminals 1 (+) and 4 (-).
7. If the voltage is less than +9.0 V dc, replace the DC/DC card. If the voltage is more than +9.0 V dc,

the charging circuit is working correctly, replace the battery pack.

Checking the Car-Battery Adapter

Note: There are several types of adapters but the checkout procedure is the same for both of them.

1. Unplug the Car-Battery Adapter cable from the computer.
2. Plug the Car-Battery Adapter into the cigarette lighter socket.

Note: If the adapter is already plugged in, reset it.

3. Measure the output voltage of the Car-Battery Adapter cable. See the following figure.

Pin	Voltage (V dc)
1	+19.0 to +21.0
2, 3	Ground

- If the voltage is correct and the power-on indicator on the Car-Battery Adapter is on all the time, the Car-Battery is working correctly. Replace the system board.

If the problem is not resolved when the system board is replaced, go to “Undetermined Problems” on page 419.

- If the voltage is outside the normal voltage range, do one of the following:
 - Try the above test procedures in a different car, if one is available.
 - Replace the Car-Battery Adapter if the computer works correctly with the AC Adapter.

Notes:

1. If the output voltage from the cigarette lighter socket of the car is less than 10.5 V dc, the power-on indicator on the Car-Battery Adapter blinks and a continuous noise can be heard. The condition of the car battery should be checked by appropriate service personal.
2. The Car-Battery Adapter does not support operational charging.

Checking the Travel Quick Charger

1. Ensure that the battery pack is operating correctly. (See “Checking the Battery Pack” on page 399.)
2. Connect the power cord to the Travel Quick Charger and the other end to an ac power outlet. Ensure that the power-on indicator is on.
 - If the power-on indicator does not turn on, check the power cord for correct continuity and installation.
 - If the problem is not corrected, replace the Travel Quick Charger or the power cord.
3. Install the battery pack into the Travel Quick Charger.
 - If the charging indicator does not start blinking, replace the Travel Quick Charger.

Checking the Backup Battery

1. Power-off the computer and unplug the AC Adapter from the computer.
2. Open the keyboard, and remove the battery pack.
3. Remove the backup battery from the shield assembly.
4. Measure the voltage of the backup battery. See the following figure.

Wire	Voltage (V dc)
Red	+2.5 to +3.7
Black	Ground

- If the voltage is correct, replace the system board.
- If the voltage is not correct, the backup battery has been discharged. Replace the backup battery.
- If the backup battery discharges quickly after replacement, replace the system board.

Checking the Standby Battery

1. Power-off the computer and unplug the AC Adapter from the computer.
2. Open the keyboard, and remove the battery pack and the diskette drive.

3. Remove the standby battery. (Refer to “1100 Standby Battery and Front IR” on page 438 to remove the battery.)
4. Measure the voltage of the standby battery.
 - If the voltage between red and black is 3.5 V dc or greater, the voltage is correct. Go to Step 10 to verify standby battery operation.
 - If the voltage is less than 3.5 V dc, go to the next step.
5. Plug the AC Adapter into the computer and power-on the computer.
6. Measure the output voltage at the connector on the system board.

Pin	Voltage (V dc)
+	+4.0
-	Ground

- If the voltage is less than +4.0 V dc, replace the DC/DC card. If the voltage is still low, replace the system board.
 - If the voltage is more than +4.0 V dc, power-off the computer, replace the standby battery, and go to the next step.
7. Ensure that the AC Adapter is plugged into the computer; then power-on the computer.
 8. Charging of the standby battery starts. A depleted battery needs approximately 30 minutes to be recharged to the operational voltage of +3.5 V dc.
 9. Unplug the AC Adapter.
 10. Verify the standby battery function by removing and installing the battery pack during suspend mode.

Note: Removing and installing the battery pack during suspend mode should be done within one minute. The resume operation must start. If the resume operation does not work, switching of power from the battery pack to standby battery will not be correct. Replace the DC/DC card.

If replacing the DC/DC card does not resolve the problem, replace the system board.

Power Management Features

Three power management modes are provided by the computer to save power consumption and prolong battery power.

Standby Mode: When in standby mode the following occurs:

- The LCD backlight turns off.
- The hard disk motor stops.

Events that cause the computer to enter the standby mode.

- Standby requested by the Fn key. (Fn+F3)
- No activity under **auto-standby** enabled by the feature utility.

Events that cause the computer to exit the standby mode (resume).

- Any key operation.

Suspend Mode: When in suspend mode, the following occur:

- The LCD backlight turns off.
- The LCD power is powered-off.
- The hard disk is powered-off.
- The CPU is stopped.

In the ThinkPad Features Program, the computer can be set to "Will not suspend even if LCD is closed."

When the computer is powered with ac power and is used with one of the following IBM PC cards, the computer can enter the *standby mode* only. The PC card and application program remain active.

- 3270 Emulation Credit Card Adapter
- 5250 Emulation Credit Card Adapter
- Token-Ring 16/4 Credit Card Adapter
- Credit Card Adapter for Ethernet

Events that prevent the computer from entering the suspend mode.

- While the communication link is running.
- When a pointing device (except a serial mouse) are selected in the **Config** menu of the Easy-Setup.

Events that cause the computer to enter the suspend mode.

- Suspend mode is requested by pressing the Fn key (Fn+F4).
- The LCD is closed.
- The keyboard is opened.
- The specified time has elapsed from the last operation with the keyboard, mouse, hard disk drive, parallel connector, diskette drive, or the AC Adapter is plugged in. The time is specified by **Suspend Timer** in the ThinkPad Features program.
- The battery condition is low. The battery power indicator blinks (orange).
- The *PS2 OFF* command is set in the ThinkPad Features program.

Events that cause the computer to exit the suspend mode (resume or hibernate).

- (Resume) The LCD is opened.
- (Resume) The keyboard is closed.
- (Resume) Real time clock alarm signaled.
- (Resume) Ring indicator (RI) signaled by serial or PCMCIA device.
- (Resume) The Fn key is pressed.
- (Hibernate) Timer conditions are satisfied to enter the hibernation mode.

Hibernation Mode: When in hibernation mode, the following occurs.

- The system status, RAM, VRAM, and setup data are stored on the hard disk.
- The system is powered-off.

The computer cannot enter the hibernation mode if the computer is powered with ac power and one of the following IBM PC cards is used.

- PCMCIA Data/FAX Modem
- High Speed PCMCIA Data/FAX Modem
- 3270 Emulation Credit Card Adapter
- 5250 Emulation Credit Card Adapter
- Token-Ring 16/4 Credit Card Adapter
- Credit Card Adapter for Ethernet

Events that cause the computer to enter the hibernation mode:

- The hibernation mode is requested by the Fn key (Fn+F12).
- Timer conditions are satisfied in suspend mode.
- Critical low battery condition.

Event that cause the computer to exit the hibernation mode.

- The power-on switch is operated.

When power is turned on, the hibernation history of the boot record on the hard disk is recognized and system status is restored from the hard disk to resume operation.

Port Replicator Power Overload: If intermittent power shut-downs occur while using two or more PCMCIA devices with a port replicator, suspect an over-current problem. Some PCMCIA devices use more than the recommended maximum power. If the maximum usage for each device occurs simultaneously, the total current can exceed the replicator power limit, thereby causing a power shut down. Isolate this problem by removing one of the devices and using the computer under the same condition to see whether a power shut down occurs. Do this procedure for all devices, then determine the cause.

Symptom-to-FRU Index

The Symptom-to-FRU Index lists the symptoms and errors and the possible causes. The most likely cause is listed first.

Note: Perform the FRU replacement or actions in the sequence shown in the “FRU/Action” columns. If a FRU did not solve the problem, put the original part back in the computer. Do not replace a non-defective FRU.

This index can also be used to help you decide which FRUs to have available when servicing a computer.

Numeric error codes show the errors detected in POST or system operation. In the following error codes, **X** can be any number.

If no codes are available, use narrative symptoms.

If the symptom is not listed, go to “Undetermined Problems” on page 419.

Note: For IBM devices not supported by diagnostic codes of the ThinkPad computers, see the manual for that device.

Numeric Error Codes

Symptom/Error	FRU/Action
10X	1. System Board
110	1. Go to “Memory Checkout” on page 393. 2. IC DRAM Card or DIMM Card 3. System Board
111	1. Go to “Memory Checkout” on page 393. 2. Expansion Unit/Port Replicator 3. System Board
158 (HDP was not set even though the supervisor password is set.)	1. Set a HDP.
159 (HDP is not set the same as the supervisor password.)	1. Set a correct HDP.
161	1. Go to “Checking the Backup Battery” on page 403. 2. Backup Battery 3. System Board
163 (Time and Date was not set.)	1. Set Time and Date. 2. System Board

I9990301 I9990302 I9990305	<ol style="list-style-type: none"> Reseat the boot device. Check the startup sequence for the correct boot device. Check that operating system has no failure, or is installed correctly.
I9990303	<ol style="list-style-type: none"> System Board
Other codes not listed above	<ol style="list-style-type: none"> Go to "Undetermined Problems" on page 419.

FRU Codes

If an error is detected by the diagnostic tests, a *four-digit* FRU code is displayed. The FRU code indicates two suspected FRUs. Replace the FRU that is indicated by the *two leftmost digits* first, then replace the FRU indicated by the *two rightmost digits*. No FRU is assigned to code 00. If only one FRU is suspected, the other FRU code is filled with zeros. See the referenced page before replacing the FRU.

FRU Code	FRU/Action
10	System Board
11	Processor Card
16	DSP Card
17	Front IR Unit
18	Rear IR Unit
20	Memory (See "Memory Checkout" on page 393.)
30	Reserved
32	External Keyboard
33	External Mouse
40	LCD Assembly
45	External CRT
50	<ol style="list-style-type: none"> Reseat the Drive (FDD-1) Diskette Drive (FDD-1)
51	<ol style="list-style-type: none"> Reseat the Drive (FDD-2) Diskette Drive (FDD-2)

FRU Code	FRU/Action
60	<ol style="list-style-type: none"> 1. Reseat the Hard Disk Drive (HDD-1) 2. Hard Disk Drive (HDD-1)
61	<ol style="list-style-type: none"> 1. Reseat the Hard Disk Drive (HDD-2) 2. Hard Disk Drive (HDD-2)
70	PCMCIA-2 (Replicator)
71	PCMCIA (in FDD compartment)
80	Cellular Modem

Note: The device ID and error codes are used to indicate the detail portion of the FRU that caused the error. If replacing a FRU does not correct a problem, see the Device ID or error code from the previous failure. If they have changed, the cause might be that the new FRU is defective or that the FRU was incorrectly installed.

If the problem remains after replacement of the FRUs, go to “Undetermined Problems” on page 419.

Beep Symptoms

Symptom/Error	FRU/Action
Continuous beeps.	System Board
One beep and a blank, unreadable, or flashing LCD.	<ol style="list-style-type: none"> 1. Reseat all LCD connectors. 2. LCD Assembly 3. System Board 4. DC/DC Card
One beep, and the message “Unable to access boot source.”	<ol style="list-style-type: none"> 1. Boot device 2. System Board
One long, two short beeps and a blank or unreadable LCD.	<ol style="list-style-type: none"> 1. System Board 2. LCD Assembly
One long beep followed by four short beeps each time the power switch is operated. (System cannot power-on due to low battery voltage.)	Connect the AC Adapter or install a fully-charged battery.
One beep every second. (System is shutting down due to low battery voltage.)	Connect the AC Adapter or install a fully-charged battery (allows system to complete shutdown before changing the battery).
Two short beeps with error codes.	POST error. See “Numeric Error Codes” on page 408.
Two short beeps with blank screen.	System Board

No Beep Symptoms

Symptom/Error	FRU/Action
No beep, power-on indicator not on, and a blank LCD during POST.	<ol style="list-style-type: none"> 1. Go to “Power Systems Checkout” on page 398. 2. System Board 3. DC/DC Card 4. Power sources
No beep, power-on indicator on, and a blank LCD during POST.	<ol style="list-style-type: none"> 1. System Board 2. DC/DC Card 3. Processor Card
No beep, power-on indicator on, and a blinking cursor only during POST.	<ol style="list-style-type: none"> 1. System Board 2. Processor Card 3. DC/DC Card
No beep during POST but system runs correctly.	<ol style="list-style-type: none"> 1. Turn the volume up and check the speaker 2. Speaker 3. DSP Card 4. DC/DC Card

LCD Related Symptoms

The TFT LCD for the notebook computer contains over 921 000 thin film transistors (TFTs). A small number of missing, discolored or lighted dots (on all the time) is characteristic of TFT LCD technology, but excessive pixel problems can cause viewing concerns.

The LCD should be replaced if the number of dots satisfies the following condition.

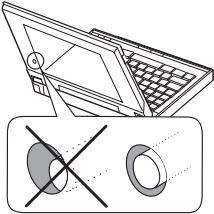

- The number of missing, discolored, or lighted dots in any colored background is 21 or more.

Note: For Model 755CV, see also “Model 755CV Symptoms” on page 414 for LCD related symptoms.

Symptom/Error	FRU/Action
No beep, power-on indicator on, and a blank LCD during POST.	<ol style="list-style-type: none"> 1. System Board 2. DC/DC Card 3. Processor Card
<ul style="list-style-type: none"> • LCD backlight not working, or • LCD too dark, or • LCD brightness cannot be adjusted, or • LCD contrast cannot be adjusted. 	<ol style="list-style-type: none"> 1. Reseat the LCD connectors. 2. LCD Assembly 3. Interposer Card 4. DC/DC Card

Symptom/Error	FRU/Action
<ul style="list-style-type: none"> LCD screen unreadable, or Characters missing pels, or Screen abnormal, or Wrong color displayed. 	<ol style="list-style-type: none"> See note for “LCD Related Symptoms.” Reseat all LCD connectors LCD Assembly System Board Interposer Card
LCD has extra horizontal or vertical lines displayed.	LCD Assembly

Model 755CV Symptoms

Symptom/Error	FRU/Action
The screen is black when the LCD cover is installed.	<ol style="list-style-type: none"> Verify that the LCD cover is firmly installed on the LCD. Diagnose the LCD assembly by following “LCD Related Symptoms” on page 413.
The LCD is wavy when the computer is placed on the overhead projector.	Some overhead projectors interfere with the LCD of the computer. Use another overhead projector.
The LCD stays on even when the LCD cover is removed.	<p>Make sure that the switch on the rear of the LCD is not stuck. If it is stuck, release it with the tip of a ball-point pen.</p> 
<ul style="list-style-type: none"> Abnormal screen Uneven color on the screen Spot on the screen 	<ol style="list-style-type: none"> Check that the white film on the LCD cover is clean. Gently wipe the film with a dry, soft cloth, such as a lens cleaner. LCD Cover Diagnose the LCD assembly by following “LCD Related Symptoms” on page 413. <p>Note: The customer may be responsible for repair costs if the LCD cover was damaged due to misuse, excessive force, scratch, or liquid spilled by the customer.</p>
The computer has an intermittent problem when you use it on the overhead projector.	Problem such as high environmental temperature might be the cause. Use the stand supplied with the computer.

Symptom/Error	FRU/Action
<p>The remote control does not work.</p>	<ol style="list-style-type: none"> 1. Check that two AAA alkaline batteries are installed in the remote control. 2. Check that two AAA alkaline batteries in the remote control are at their normal energy (voltage) level. 3. Enable the IR port of the computer with the ThinkPad Features program. (Disable the serial port at this time.) 4. Refer to the trouble shooting section in the Help menu of the Mind Path Presentation F/X program. Set up this program following the guide. 5. If the preceding items are correct, the radiation from the light of the overhead projector might be interfering the IR port of the computer. Disable the rear IR port of the computer, and use the remote control with the front IR port. 6. Use the remote control with another computer, which IR port works normally. If the remote control does not work, the remote control is not working properly. <p>If there is still a problem, refer to "Infrared Related Symptoms" on page 418.</p>

Keyboard/TrackPoint III Related Symptoms

Symptom/Error	FRU/Action
Keyboard (one or more keys) does not work.	<ol style="list-style-type: none"> 1. Reseat the three keyboard cables. 2. Keyboard 3. Interposer Card 4. System Board
TrackPoint III does not work.	<ol style="list-style-type: none"> 1. Go to “TrackPoint III Checkout” on page 396. 2. Keyboard 3. Interposer Card 4. System Board
Pointer moves automatically or does not work correctly.	<ol style="list-style-type: none"> 1. See “TrackPoint III Checkout” on page 396.

Indicator Related Symptoms

Symptom/Error	FRU/Action
Indicator incorrectly remains off or on, but system runs correctly.	<ol style="list-style-type: none"> 1. Reseat the status indicator cable. 2. Status Indicator 3. Interposer Card 4. System Board
Battery power status indicator blinks from green, yellow, to orange.	<ol style="list-style-type: none"> 1. Check that a correct battery is installed. 2. Set the battery storage switch to ON. 3. Battery Pack 4. DC/DC Card 5. System Board

Power Related Symptoms

Symptom/Error	FRU/Action
Power shut down during operation.	<ol style="list-style-type: none"> 1. Go to “Power Systems Checkout” on page 398. 2. Battery Pack 3. Remove the battery pack and let it cool for two hours. 4. DC/DC Card 5. Power sources
The system will not power-off. (See “Reset Pushbutton” on page 422.)	<ol style="list-style-type: none"> 1. Press the Reset pushbutton. 2. System Board

Function/Audio Related Symptoms

Symptom/Error	FRU/Action
The system will not suspend or resume by opening or closing the keyboard.	<ol style="list-style-type: none"> 1. Go to “Suspend Mode” on page 405 and check that the computer can enter suspend mode. 2. DC/DC Card 3. Interposer Card 4. System Board
The system will not suspend or resume by opening or closing the LCD.	<ol style="list-style-type: none"> 1. Go to “Suspend Mode” on page 405 and that check that the computer can enter suspend mode. 2. Interposer Card 3. DC/DC Card 4. System Board
Battery Fuel-Gauge does not go higher than 90%.	Go to “Checking the Battery Pack” on page 399 and see the note.
Memory count (size) appears differently from actual size.	Go to “Memory Checkout” on page 393.
System configuration does not match the installed devices.	Go to “Checking the Installed Devices List” on page 422.
System hangs intermittently.	Go to “Intermittent Problems” on page 418.

Peripheral Device Related Symptoms

Symptom/Error	FRU/Action
External display does not work correctly.	<ol style="list-style-type: none"> 1. See “External Display Self-Test” in “Common Devices Checkout” section.
Printer problems.	<ol style="list-style-type: none"> 1. Run Printer Self-test. 2. System Board 3. Parallel Port Device 4. Cable
Serial or parallel port device problems.	<ol style="list-style-type: none"> 1. Device 2. Device Cable 3. System Board

Infrared Related Symptoms

Symptom/Error	FRU/Action
Unable to communicate using the Infrared (IR) Port.	<ol style="list-style-type: none">1. Make sure the setup for the IR is correct.2. Make sure there are no fluorescent lights near the computer. The computer may receive electrical noise from the fluorescent light.3. Run the advanced diagnostic test. If an error occurs and a FRU code is displayed, replace the parts shown by the FRU code.4. For Model 755CV, if the remote control is enabled, the communication with the IR port is disabled. Run the Mind Path Presentation F/X program and set the infrared to OFF; then observe the symptom.

Other Symptoms

Symptom/Error	FRU/Action
Errors occur only when Port Replicator is used.	See “Port Replicator Checkout” in “Common Devices Checkout” section.
PCMCIA slot pin is damaged.	PCMCIA Slots Assembly

Note: If you cannot find a symptom or error in this list and the problem remains, see “Undetermined Problems” on page 419.

Intermittent Problems

Intermittent system hang problems can be caused by a variety of reasons that have nothing to do with a hardware defect such as: cosmic radiation, electrostatic discharge, or software errors. FRUs replacement should only be considered when a recurring problems exits.

When analyzing the intermittent problem, do the following:

1. Run the advanced diagnostic test for the system board in loop mode at least 10 times.
2. If no error is detected, do **not** replace any FRUs.

3. If any error is detected, replace the FRU shown by the FRU code. Rerun the test to verify that no more errors exist.

Undetermined Problems

You are here because the diagnostic tests did not identify which adapter or device failed, installed devices are incorrect, a short circuit is suspected, or the system is inoperative. Follow the procedures below to isolate the failing FRU (do not isolate non-defective FRUs).

Verify that all attached devices are supported by the computers.

Verify that the power supply being used at the time of the failure is operating correctly. (See "Power Systems Checkout" on page 398.)

1. Power-off the computer.
2. Check the cables, wires, and connectors for short circuits and open circuits. Visually check them for damage. If any problems are found, replace the FRU.
3. Remove or disconnect all of the following devices.
 - a. Non-IBM devices
 - b. Devices attached to the expansion bus connector
 - c. Printer, mouse, and other external devices
 - d. Battery pack
 - e. Hard disk drive
 - f. Diskette drive or the device attached to the diskette drive connector
 - g. IC DRAM card or DIMM card
 - h. PC Cards

Note: Remember that removing the hard disk drive, an IC DRAM card, or any adapter or device, might cause configuration errors. Ignore error code 174.

4. Power-on the computer.
5. Determine if the problem has changed.
6. If the problem does not occur again, reconnect the removed devices one at a time until you find the failing FRU.
7. If the problem remains, replace the following FRUs one at a time. Do not replace a non-defective FRU.
 - DC/DC card
 - Interposer card
 - LCD assembly
 - System board
 - Processor card

Related Service Procedures

This section provides information about the following:

- “Status Indicators”
- “How to Run the Diagnostics” on page 421
- “Error Log” on page 421
- “Checking the Installed Devices List” on page 422
- “Password Combinations” on page 422
- “How to Run the Low Level Format” on page 423
- “PC Test Card LED” on page 423
- “Fn Key Combinations” on page 423
- “How To Run the Keyboard Diagnostics” on page 424

Status Indicators

The system status indicators show the current computer status in different colors (green, yellow, and orange).

Symbol	Color	Meaning
	Blinking green	Speaker sounds
	Green	Battery fully charged
	Yellow	Battery usable
	Orange	Battery low, or if  is green, the operational charge cannot be performed.
	Blinking orange	Battery almost depleted
	All blinking	Battery storage switch is set off
	Orange, green, or yellow	if  is blinking twice every 3 seconds, the battery is discharging.
	Green	Battery charging
	Orange	PC card in-use
	Orange	Diskette drive in-use
	Orange	Hard disk drive in-use
	Green	Keys in Num Lock mode
	Green	Keys in Caps Lock mode
	Green	Keys in Scroll Lock mode

Symbol	Color	Meaning
	Green	Computer in suspend mode
	Blinking green	Computer resuming normal mode
	Green	Computer powered on

How to Run the Diagnostics

Use either the TrackPoint III or the cursor move keys to interact with the tests. The Enter key works the same as selecting the OK icon to reply OK.

1. Press and hold the F1 key; then power-on the computer. Hold the F1 key down until the Easy-setup screen appears.
 2. Select **Test** and press Enter.
 3. Select a device and press Enter to run the test. To test the Infrared port, select the "SystemBoard" icon.
 4. The test progress screen appears.
 5. **OK** appears when the test ends without any errors.
 6. Start the **Advanced Diagnostic test** by pressing **Ctrl+A** on the basic diagnostic menu screen.
 7. Select **Tool** to install the tools.
 8. Select a device, press the **space** key, and install the tool. Multiple devices can be selected by repeating this step.
- A √ mark appears for the selected device.
9. Select **OK** and press Enter if the selection is OK.
 10. Select a device and press Enter to start the tests.
 11. Select **Test All** to test all devices.
 12. Select **Loop Test** to loop tests.

A loop option menu appears in which a device loop or all loop can be selected. Select a device and press the **space** key to select a device. Repeat this step to select multiple devices. Press Enter to start the diagnostic loop. If no device is selected, all device tests are looped.

13. To exit the loop, keep pressing **Ctrl+Pause** until the test exits. A beep sounds to notify that the exit interrupt is sensed by the test program.

Error Log

Diagnostic errors are printed on the printer that is attached to the parallel port when the error is detected. The error is also logged in the system memory.

Do the following to display the errors.

1. End the test, if it is running.
2. Press **Ctrl+A** to select the advanced diagnostic mode.
3. Press **Ctrl+E**.

4. The error log appears.
5. To exit the screen, select the cancel icon or press Esc.

The error log is not saved when system power is powered-off.

Reset Pushbutton

The reset pushbutton resets the system and forces the power to be powered-off . Use this pushbutton when the power is not completely off or the system is hung. See “Rear View” on page 459 for the location of the pushbutton.

Checking the Installed Devices List

If a device is installed but the icon appears in a gray shade rather than a dark shade on the basic diagnostics screen, the device is defective. Reseat the device connectors. If the symptom remains, replace the device or the system board. If needed, adjust the contrast control to clearly distinguish the shades of the icon.

If a device that is not installed appears in a dark shade, for example, FDD-2 appears in a dark shade when *NO* second FDD is installed, do the following.

1. Replace the **first** device, such as a FDD-1, HDD-1, or PCMCIA-1.
2. If the problem remains, replace the system board.

PCMCIA-1, Parallel, and Serial icons are always displayed in dark shade, because the icons represent subsystems of the system board and not attachment of the devices.

The HDD-1, FDD-1, or PCMCIA-1 represents the **first** drive in the system configuration, respectively. Similarly, the HDD-2, FDD-2, or PCMCIA-2 represents the **second** drive, usually attached through a port replicator or an expansion unit.

Password Combinations

The password relationship is:

- ***When POP is the same as HDP***
The POP prompt appears, but the HDP prompt does not appear.
- ***When POP is not the same as HDP***
Both POP and HDP prompts appear.
- ***PAP and HDP***
When PAP is used, the HDP is enabled automatically, but no HDP prompt appears. The HDP is set the same as PAP.

How to Run the Low Level Format

Do the following to format the hard disk.

Note: Make sure the drive address to be formatted is correct. This procedure will erase all information on the disk.

1. Power-off the computer.
2. Insert the **ThinkPad 755Ce hardware maintenance diskette** into diskette drive **A** and power-on the computer. (You can use this maintenance diskette for all ThinkPad models.)
3. Select **Format the hard disk** from the main menu.
4. Select the drive from the menu.
5. Follow the instructions on the screen.

PC Test Card LED

The green LED on the PC test card turns on when the PCMCIA test is running. If the LED does not turn on, check that the card is installed correctly by reseating the card. If it still does not turn on after it is reseated, try using another slot for the test. If the LED still does not turn on and the test fails, replace the FRU shown in the diagnostic error code.

Fn Key Combinations

The following table shows the **Fn** key and function key combinations and their corresponding functions.

The Fn key works independently from the operating system. The operating system obtains the status through the system management interface to control the system.

Fn +	Description
F1	Reserved
F2	Fuel-gauge display ON/OFF
F3	Standby mode invocation
F4	Suspend mode invocation
F5	Audio volume Down
F6	Audio volume UP
F7	LCD/CRT display switching
F8	Reserved
F9	Reserved
F10	Reserved
F11	Power management mode switching (Toggles High power, Intelligent, Economy)
F12	Hibernation invocation

How To Run the Keyboard Diagnostics

Do the following to run the keyboard test.

1. Go to the advanced diagnostic screen menu by pressing **Ctrl+A** in the Easy-Setup menu.
2. Go to the keyboard diagnostic test menu by pressing **Ctrl+K**.
3. Check that when each key is pressed, the key position on the keyboard layout on the screen changes to a black square.

Note: When a Fn key is pressed, a black square briefly appears.

Product Overview

The following table shows an overview of the system features.

Feature	Description
Processor	<ul style="list-style-type: none">• 755CE, 755CSE, 755CV<ul style="list-style-type: none">– Intel DX4 100/33 MHz• 755CX<ul style="list-style-type: none">– P54C-75 MHz w/ L2 cache

PCMCIA	One Type-III or two Type-II

FRU Removals and Replacements

This section contains information about removals and replacements.

- An electrostatic discharge (ESD) strap must be used to establish personal grounding.
The system board is sensitive to, and can be damaged by, electrostatic discharge. Establish personal grounding by touching a ground point with one hand before touching these units.
- The arrows in the “Removals and Replacements” section show the direction of movement to remove a FRU, or to turn a screw to release the FRU. The arrows are marked in numeric order, in square callouts, to show the correct sequence of removal.
- When other FRUs must be removed before removing the failing FRU, they are listed at the top of the page.
- To replace a FRU, reverse the removal procedure and follow any notes that pertain to replacement. See “Locations” for internal cable connections and arrangement information.
- When replacing a FRU, use the correct screw size as shown in the procedures.

Safety Notice 8: Translation on page 13

Before removing any FRU, power-off the computer, unplug all power cords from electrical outlets, remove the battery pack, and then disconnect any interconnecting cables.

Safety Notice 3: Translation on page 9

The battery pack contains small amounts of nickel. Do not disassemble it, throw it into fire or water, or short-circuit it. Dispose of the battery pack as required by local ordinances or regulations.

Safety Notice 1: Translation on page 7

Before the computer is powered-on after FRU replacement, make sure all screws, springs, or other small parts, are in place and are not left loose inside the computer. Verify this by shaking the computer and listening for rattling sounds. Metallic parts or metal flakes can cause electrical short circuits.

1010 Rear Connector Door

Remove the center latch **1**; then remove the rear connector door by flexing it **2**.

1015 Foot

To replace the foot:

- Align the foot in the open position with one pivot in its hinge in the base cover
- Press the other pivot point into position with your thumb or finger

1020 Battery Pack

Notes:

1. Be careful that the computer does not fall backward when the battery pack is removed.
2. When replacing the battery pack, check that the storage switch of the new battery is set to the on (I) position. Do not operate the storage switch of a battery that has been used and is going to be re-used.
3. Check that the keyboard latch springs are in place.

1030 Diskette Drive

- Battery Pack (1020)

Note: Remove the diskette drive exactly as shown in the figure. Do not apply any extra force to the top surface of the diskette drive. Make sure the media is removed, or the media and the drive may be damaged.

Warning: When replacing the diskette drive, check that the backup battery and standby battery are seated correctly to prevent damage to the diskette drive.

After replacing the diskette drive, latch the removal strap into the correct position.

1040 Hard Disk Drive

- Battery Pack (1020)

Notes:

1. **Do not drop or apply any shock to the hard disk drive.** The hard disk drive is sensitive to physical shock. Incorrect handling can cause damage it, and cause permanent loss of data on the hard disk. Before removing the hard disk drive, have the user make a backup copy of all the information on the hard disk. Never remove the hard disk drive while the system is operating or is in suspend mode.
2. Remove the hard disk drive exactly as shown in the figure. Do not apply any extra force to the hard disk drive when removing it.

Note: After replacing the hard disk drive, latch the removal strap into the correct position.

1050 IC DRAM Card or DIMM Adapter

- Battery Pack (1020)
- Diskette Drive (1030)

Note: One of the following combinations occupies the slot depending on the configuration.

- IC DRAM card + IC DRAM card base
- DIMMs on DIMM adapter

If the IC DRAM Card is installed:

Warning: The IC DRAM card is sensitive to physical shock. Incorrect handling of the card can damage it. The eject tape (P/N 53G9318) must be used to remove the card.

If the DIMM Adapter is installed:

Press both locks at the same time and remove the DIMM.

While holding the strap **A**, pull the DIMM adapter toward the front to remove it.

Notes:

1. If the IC DRAM cards or the DIMM are not installed and the base plate is installed instead of these cards, remove the plate as follows:
 - a. Pinch the projection **A** on the left side of the plate; then pull the plate slightly toward the front.
 - b. Raise the rear portion of the plate and remove it.

2. When inserting the DIMM into either connector on the DIMM adapter:
 - a. Locate the triangle **A** on the right side of the socket.
 - b. With the notched end of the DIMM **B** toward the triangle, insert the DIMM into the socket.
 - c. Pivot the DIMM until it snaps into place.

If you have another DIMM to install, insert it in the other socket the same way.

1070 Diskette Drive Bezel

- Battery Pack (1020)
- Diskette Drive (1030)

Insert a coin between the diskette drive bezel and the computer as shown **1** and push the bezel from the bottom of the computer **2** to remove it.

1080 Keyboard Unit

- Battery Pack (1020)

Loosen the three screws **2**, and push **3** to release the four top cover latches at the rear side of the system unit.

When removing the screw covers **1**, use a small screwdriver.

The keyboard unit is connected to the system board with flexible cables.

Warning: Do not pull the keyboard cables. The keyboard cables can be damaged if the keyboard is disconnected without releasing the three latches **5**.

Notes:

1. When replacing the keyboard, check that the three cables are clean, and inserted straight and fully into the connectors. Slide both ends of each latch at the same time to make sure that each cable is correctly inserted. Go to “Keyboard/Auxiliary Input Device Checkout” on page 396 and test all keys before returning the computer to the customer.
2. When replacing the top cover, insert the four latches at the rear side of the cover into the foot guide of the LCD; push the right, left, and front sides to snap it into place.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
2	Top cover (3)	4 mm
Note: Make sure you use the correct screw.		

1090 Status Indicator

- Battery Pack (1020)
- Keyboard Unit (1080)

Warning: Do not pull the status indicator cable. The cable can be damaged if the status indicator is disconnected without releasing the latch in step 2.

Note: When replacing the indicator, insert the flexible cable straight into the connector until the head of the cable stops. Slide both ends of the latches at the same time to make sure that the cable is correctly inserted.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	LED Stand off (2)	6 mm
Note: Make sure you use the correct screw.		

1100 Standby Battery and Front IR

- Battery Pack (1020)
- Diskette Drive (1030)

Where:

- A** is the IR Cable.
- B** is the Standby Battery Cable.
- C** is the IR Lens.

Note: When replacing the battery, make sure the battery is seated correctly. Make sure the IR Lens **2** is in the correct position by sliding it end to end.

Step	Location (Quantity)	Length
1	cover (1)	4 mm

Note: Make sure you use the correct screw.

Safety Notice 2: Translation on page 8

The standby battery contains a small amount of nickel and cadmium. Do not disassemble it, recharge it, throw it into fire or water, or short-circuit it. Dispose of the battery as required by local ordinances or regulations.

1110 Backup Battery

- Battery Pack (1020)

Safety Notice 4: Translation on page 10

The backup battery is a lithium battery and can cause a fire, explosion, or severe burn. Do not recharge it, remove its polarized connector, disassemble it, heat it above 100°C (212°F), incinerate it, or expose its cell contents to water. Dispose of the battery as required by local ordinances or regulations. Use of an incorrect battery can result in ignition or explosion of the battery. Replacement batteries can be ordered from IBM or IBM Authorized Dealers.

1115 Logic Assembly

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1040)
- Keyboard Unit (1080)
- Status Indicator (1090)
- Standby Battery and Front IR (1100)

The screw **1** is located at the rear bottom side.

See next page.

When Replacing Logic Assembly

When replacing the logic assembly, align the power-key slide hub with the power-switch actuator by moving the power-key in the direction of the arrow

1. See the large circle in the figure. Before tightening any screws, check that the power-switch operates correctly.

Step	Location (Quantity)	Length
1	Bottom cover (1)	4 mm
5	Logic assembly (4)	8 mm

Note: Make sure you use the correct screw.

1120 Shield Assembly

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1040)
- Keyboard Unit (1080)
- Status Indicator (1090)
- Standby Battery and Front IR (1100)
- Backup Battery (1110)
- Logic Assembly (1115)

See the next page when you replace the parts.

The microphone cable can pick up electrical noise if the cable path is incorrect.

Do the following to place the cable in its correct position.

1. Position the cable as shown.

2. Install the shield assembly.
3. Move the end of cable to the right.

The following figure shows the final path of the cable. Make sure the cable is not positioned in any shaded area.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	Shield cover (1)	4 mm
2	Shield cover (2)	6 mm
3	Shield cover (1)	14 mm
4	Shield cover (1)	Flat head
Note: Make sure you use the correct screw.		

1130 DC/DC Card

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1040)
- Keyboard Unit (1080)
- Status Indicator (1090)
- Standby Battery and Front IR (1100)
- Backup Battery (1110)
- Logic Assembly (1115)
- Shield Assembly (1120)

1140 DSP Card

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1040)
- Keyboard Unit (1080)
- Status Indicator (1090)
- Standby Battery and Front IR (1100)
- Backup Battery (1110)
- Logic Assembly (1115)
- Shield Assembly (1120)
- DC-DC Card (1130)

Remove the following:

- Mini-Jack Holder
- Modem Guide
- Modem Lever
- Microphone Cable

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	DSP card (1)	6 mm
2	DSP card (1)	14 mm

Note: Make sure you use the correct screw.

1150 Interposer Card and Rear IR

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1040)
- Keyboard Unit (1080)
- Status Indicator (1090)
- Standby Battery and Front IR (1100)
- Backup Battery (1110)
- Logic Assembly (1115)
- Shield Assembly (1120)
- DC-DC Card (1130)
- DSP Card (1140)

Where:

A is the Rear IR.

B is the Interposer Card.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	Interposer card (1)	4 mm

Note: Make sure you use the correct screw.

1160 System Board Assembly

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1040)
- Keyboard Unit (1080)
- Status Indicator (1090)
- Standby Battery and Front IR (1100)
- Backup Battery (1110)
- Logic Assembly (1115)
- Shield Assembly (1120)
- DC/DC Card (1130)
- DSP Card (1140)
- Interposer Card and Rear IR (1150)
- Processor Card (1180)
- PCMCIA Slot Assembly (1170)

Notice

The EEPROM on the system board contains the vital product data (VPD), that is, system unit serial number, system board serial number, and other computer unique data. When the system board is replaced, the system unit serial number must also be restored. Use the **Set system identification** utility on the maintenance diskette to restore the number.

Do not power-off the computer when restoring the VPD.

The serial number label is attached to the bottom cover.

Notes:

1. Before removing and replacing the system board, make sure that the PCMCIA cards are removed and the eject levers are not sticking out.
2. Do not pull the PCMCIA slot assembly while removing the system board.

1170 PCMCIA Slot Assembly

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1040)
- Keyboard Unit (1080)
- Status Indicator (1090)
- Standby Battery and Front IR (1100)
- Backup Battery (1110)
- Logic Assembly (1115)
- Shield Assembly (1120)
- DC/DC Card (1130)
- DSP Card (1140)
- Interposer Card and Rear IR (1150)
- Processor Card (1180)
- System Board Assembly (1160)

Notes:

1. When handling the PCMCIA slot assembly, be careful not to disassemble any part of it. The slot assembly is not solidly fixed when it is removed from the system board or the FRU.
In step **3**, gently pull up the bottom of the center area of the connector board edge with your fingers.
2. The screw stand at each corner of the PCMCIA slot is

easy to remove. Make sure that the screw stand is correctly positioned when the slot is replaced. Do not replace the slot without the screw stand.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	PCMCIA slot, upper (2)	4 mm
2	PCMCIA slot, lower (2)	14 mm
Note: Make sure you use the correct screw.		

1180 Processor Card

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1040)
- Keyboard Unit (1080)
- Status Indicator (1090)
- Standby Battery and Front IR (1100)
- Backup Battery (1110)
- Logic Assembly (1115)

Turn the system board upside down. Then remove any metal tape holding the card.

To remove the processor card, gently lift the area shown by **A** straight up. Do not pull the other areas.

Note: If the processor card is not installed correctly, the computer may not turn on. Reinstall the card in this case.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
1	Processor card assembly	14 mm
Note: Make sure you use the correct screw.		

1190 LCD Assembly

- Battery Pack (1020)
- Keyboard Unit (1080)
- Status Indicator (1090)

Note: When removing the LCD cables **1**, pull the connector straight up. Incorrect handling can damage the connector.

Use the following table for reference when replacing parts.

Step	Location (Quantity)	Length
3	LCD hinge (4)	4 mm
Note: Make sure you use the correct screw.		

Safety Notice 5: Translation on page 11

If the LCD breaks and the fluid from inside the LCD gets into your eyes or on your hands, immediately wash the affected areas with water for at least 15 minutes. Seek medical care if any symptoms from the fluid are present after washing.

Note: To clean the LCD, gently wipe the LCD with a dry, soft cloth. Do not use alcohol or detergent to clean the LCD.

To avoid damaging the LCD, do not scratch or apply any force to its surface.

1195 LCD Rear Cover (755CV only)

Slightly push out and release the latches **1**.

Note: While the cover is removed from the LCD, do not touch the film (**2**) on the rear cover.

1200 Lower Shield Assembly

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1040)
- Keyboard Unit (1080)
- Status Indicator (1090)
- Standby Battery and Front IR (1100)
- Backup Battery (1110)
- Logic Assembly (1115)
- Shield Assembly (1120)
- DC/DC Card (1130)
- DSP Card (1140)
- Interposer Card and Rear IR (1150)
- Processor Card (1180)
- PCMCIA Slot Assembly (1170)
- System Board Assembly (1160)

1210 Memory Card

- Battery Pack (1020)
- Diskette Drive (1030)
- Hard Disk Drive (1040)
- Keyboard Unit (1080)
- Status Indicator (1090)
- Standby Battery and Front IR (1100)
- Backup Battery (1110)
- Logic Assembly (1115)
- Shield Assembly (1120)
- DC/DC Card (1130)
- DSP Card (1140)
- Interposer Card and Rear IR (1150)
- Processor Card (1180)
- PCMCIA Slot Assembly (1170)
- System Board Assembly (1160)
- Lower Shield Assembly (1200)

Note: If the computer does not complete POST after changing the memory card, reseal the card and try again.

Locations

Front View

- 1** LCD
- 2** Built-in Microphone
- 3** Brightness Control
- 4** Status Indicator
 - See "Status Indicators" on page 420.
- 5** External Input Device Connector
- 6** PCMCIA Slot

- 10** Rear Infrared Port
- 11** System Expansion Connector

A multimedia portable expansion unit, port replicator, or port replicator with PCMCIA can be connected to this interface to support the following features.

- 16-bit AT-bus interface
- Serial port
- Parallel port
- Keyboard and mouse
- HDD connection
- LED control signals
- Visual signals
- Audio signals
- FDD signals
- PCMCIA signals
- Power controls
- Power line

External Diskette Drive Test

Use the following procedure to isolate the diskette problem to a controller, drive or diskette. A scratch, write-enabled 2HD diskette is required.

1. Select the icon **FDD** on the **TEST MENU**. By doing this, the controller test and the drive read/write test run. If the controller test detects an error, FRU code 10 appears. In this case, replace the system board.
2. If the controller test run without errors, follow the instructions on the screen and insert a scratch diskette.
3. If the drive test detects an error, FRU code 50 appears. If the diskette media are known to be good, replace the drive or the drive cable.

External Display Self-Test

If the display problem occurs only when using an external display, use the following instructions to correct the problem.

Note: Before you replace a display, check the following list to see if it is connected correctly.

- 8506 and 8508 displays must be connected to an Image Adapter/A or an Image-I Adapter/A.
- 63XX and 85XX systems support either 63XX or 85XX displays.
- 85XX systems with an XGA-2 adapter support 95XX displays.
- 95XX systems support either 63XX, 85XX, or 95XX displays.
- ThinkPad models support either 85XX or 95XX displays.

If the screen is rolling, replace the display assembly. If that does not correct the problem, replace FRUs in the following order until the problem goes away:

1. Video card
2. Display adapter (any type)
3. System board
4. Bus adapter (if used)

If the screen is not rolling, run the display self-test as follows:

1. Power-off the computer and display.
2. Disconnect the display signal cable.
3. Power-on the display.
4. Set the contrast to its maximum position.
5. Set the brightness control to the center detent position.

Check for the following conditions:

- You should be able to vary the screen intensity by adjusting the contrast and brightness controls.
- The screen should be white or light gray, with a black margin (test margin) on the screen.

Note: The location of the test margin varies with the type of display. The test margin might be on the top, bottom, or one or both sides.

If you do not see a test margin on the screen, replace the display. If there is a test margin on the screen, replace the system board.

Note: On ThinkPad Models 700, 700C, 720C, 720C, do the following:

1. Video card
2. System board

External Keyboard/Auxiliary Input Device Checkout

The following auxiliary input devices may be available for IBM ThinkPad models.

- Numeric keypad
- Mouse (PS/2 compatible)
- External keyboard (with Keyboard/Miniature Mouse cable)
- If you suspect a problem with any of the auxiliary input devices (listed above), replace the device. If the problem is not corrected, replace the following FRUs one at a time to correct the problem.
 - Keyboard control card
 - System board
- If the computer receives an incorrect keyboard response, remove other external devices, check the keyboard connections, and recheck the keyboard responses. If the problem remains, replace the following FRUs one at a time to correct the problem.
 - Keyboard
 - Keyboard control card
 - System board
- If a 00030100 error message appears, power-off the computer and the external devices. Then power-on the computer before you power-on the external devices.

Fax/Modem Checkout

001

- Power-off the computer.
- Ensure that the modem is installed correctly.
- If the modem never worked in customer mode, ensure that all drivers are loaded correctly onto the computer.
- Ensure that the communication program is supported on the computer.
- Ensure that the public switch telephone network (PSTN) cable and the data access arrangement (DAA) cable, if installed, are connected correctly.

If you need to correct one of the above conditions, do so now; then continue.

Note: PCMCIA cards can be inserted and removed while the system is powered on.

- Power-on the system.
- Insert the IBM Data/FAX Modem diskette into the default diskette drive.
- If you are servicing a High Speed Internal Data/Fax Modem (Models FC3632 and FC3650), at the DOS prompt (for example, A:\), type **IBMDIAG**; then press **Enter**.
- If you are servicing a PCMCIA Data/FAX Modem (Models FC3634 and FC3635), at the DOS prompt (for example, A:\), type **ESTDIAG**; then press **Enter**.
- Follow the instructions on the screen. (If you need help, press **F1**.)

DID THE DIAGNOSTIC TESTS DETECT AN ERROR?

Yes No

002

The diagnostic tests have completed successfully. If you suspect a problem, go to Step 004.

003

Go to the Symptom-to-FRU Index for the computer you are servicing.

004

- Check the PSTN cable and the DAA cable, if installed, for continuity.

IS THE CABLE(S) GOOD?

Yes No

005

Replace the defective cable(s).

006

(Step **006** continues)

006 (continued)

– Have the customer transmit a call.

WAS THE CALL TRANSMITTED SUCCESSFULLY?

Yes No

007

Go to Step 011.

008

– Have the customer receive an incoming call on the modem.

WAS THE INCOMING CALL RECEIVED?

Yes No

009

Go to Step 014.

010

The diagnostic tests have completed successfully. If you still suspect a problem that is not software related, replace the External DAA; then replace the modem.

011

– Have the customer transmit a call at a lower speed.

WAS THE CALL TRANSMITTED SUCCESSFULLY?

Yes No

012

If installed, replace the external DAA. If you do not have an external DAA installed, or replacing the external DAA does not correct the problem, replace the modem.

013

Have the telephone line checked.

014

– Have the customer receive an incoming call on the modem at a lower speed.

WAS THE INCOMING CALL RECEIVED?

Yes No

015

If installed, replace the external DAA. If you do not have an external DAA installed, or replacing the external DAA does not correct the problem, replace the modem.

(CONTINUED)

016

Have the telephone line checked.

Printer Checkout

1. Make sure the printer is correctly connected and is powered-on.
2. Run the printer self-test.

If the printer self-test does not run correctly, the problem is in the printer. Refer to the printer service manual.

If the printer self-test runs correctly, do the following.

1. Verify the port settings in configuration.
2. Install a wrap plug on the port (indicated in configuration) and run the advanced diagnostic tests.
3. If the advanced diagnostic tests (with the wrap plug installed) do not detect a failure, replace the printer cable.

If the problem is not corrected, replace the system board.

Port Replicator Checkout

Use the following procedure to isolate a port replicator problem. A port replicator attaches to the system expansion connector at the rear of the computer.

1. Power-off the computer.
2. Remove the failing devices from the replicator.
3. Unplug the AC adapter from the replicator, if attached.
4. Remove the port replicator from the computer.
5. Reconnect the failing device directly to the computer. (If another device occupies the connector, remove it first.)
6. Go to General Checkout and follow that procedure.
7. If the advanced diagnostic device test does not find an error, suspect a problem with the port replicator or the system expansion bus.
8. Power-off the computer and reconnect the port replicator.
9. Power-on the computer and run the following advanced diagnostic tests:
 - Serial port test with the wrap plug installed on the replicator.
 - Parallel port test with the wrap plug installed on the replicator.
 - PCMCIA-2 test with the PC test card installed.
 - FDD-2 (FDD-1 if no drive is installed in the computer) drive test on the failing device.
10. If diagnostic errors appear, replace the replicator or diskette drive attachment unit.

If the problem remains after the replacement, replace the system board.
11. If power problems appear only when using the replicator, replace the replicator.

If power shut downs occur intermittently when using PCMCIA-2 devices via a port replicator, suspect an over-current problem. Some PCMCIA devices use more power; if the maximum usage of each device occurs simultaneously, the total current will exceed the limit, thereby causing a power shut down. Isolate this problem by removing one of the devices, and use the computer under the same condition, and see whether a power shut down occurs. Do this procedure for all devices then determine the cause. Customer purchase of the larger AC adapter (50W, optional) is recommended, if it is not yet in use.

TrackPoint II Checkout

- If the TrackPoint II does not work, check the configuration. If the configuration of the TrackPoint II is set to **Disabled** or **Off**, change it to **Enable** or **On**.

If the problem remains, continue.

Note: TrackPoint II automatically compensates to adjust the pointer sensor. This causes the pointer to move slightly on the screen and then stop. Pointer movement might occur when a slight, steady pressure is applied to the TrackPoint II pointer when the computer is powered-on or running, or when exceeded temperature range requires re-adjustment.

- If the cursor floats or moves erratically, power-off and disconnect the mouse. Power-on the computer. If the problem goes away, replace the mouse. If the problem remains, replace the keyboard.
- For click button or pointing stick problems:
 1. Go to the Easy-Setup screen.
 2. Select an item with the pointing stick.
 3. Press either left or right click button.
 4. Verify that both buttons work correctly.

If the pointing stick or the click button does not work, do the following.

1. Reseat the keyboard cables.
2. Replace the keyboard.
3. Replace the interposer card (355x, 360x, 750x, 755x).
4. Replace keyboard control card (720).
5. Replace the system board.

TV Tuner

The TV Tuner Pack (hereafter called TV Tuner) is an option for watching TV programs or videos on the IBM TFT color notebook computer. The computer changes to TV reception when the removable diskette drive is replaced with the TV Tuner.

The TV screen and normal computer display are easily switched by using the Hot key on the front panel of the TV Tuner.

Identifying Names and Functions

The following figure and table show the names and functions of each part of the TV Tuner.

Icons	Functions
1 Front Panel	Used to change the TV channels, switch TV mode to computer mode, and operate most functions of the TV Tuner.
2 Headphone Jack 	Connects the headphones.
3 Power Indicator	Shows the TV Tuner is powered on.
4 Power Switch 	Powered on and off the TV Tuner.
5 Hot Key 	Switches between the TV screen and computer screen.
6 Up Switch 	Increases the value such as the channel number.
7 Down Switch 	Decreases the value such as the channel number.

Icons	Functions
8 Function Key Fn	Enters the mode to change the value of each function, such as TV channel or color contrast. (See "Using the Function Key" on page 479.)
9 TV/EXT Switch 	Switches the TV mode or external video mode.
10 Volume Knob 	Controls the speaker volume.
11 Audio-In Jack 	Connects the audio-in connector of the AV cable.
12 Video-In Jack 	Connects video-in connector of the AV cable.
13 RF Connector 	Connects the active antenna unit or antenna cable.

Using the Front Panel

The following table shows how to operate all functions of the TV Tuner with the controls on the front panel.

Key	Function
Power 	Turns on the TV Tuner. This key is used only when the computer is turned on.
Hot Key 	Switches computer display and TV screen.
Up 	Increases the value of parameters, Channel Number, Color, Tint, Brightness, Contrast, Auto Tuning Sensitivity, On-screen Message Selection.
Down 	Decreases the value of parameters, Channel Number, Color, Tint, Brightness, Contrast, Auto Tuning Sensitivity, On-screen Message Selection.
Function Fn	Selects a function mode to adjust each function parameter. (See "Using the Function Key" on page 479.)
TV/Ext 	Switches the displayed video source between the receiving TV broadcast program and external devices such as VCR, video camera recorder, laser disk, and so on.

Using the Function Key: Each time you press the Function key (F₁), one of the following messages (called *On-Screen Message*) appears at the top left corner of the LCD.

The changed values are automatically saved when you return to the “TV Channel” On-Screen message. The values are not saved when you power-off the TV Tuner without returning to this message.

Message on LCD	Parameter
	TV Channel By using ◀ and ▶, you can select the channels from 2 to 69.
	Color Adjustment By pressing and holding ◀ or ▶, you can change the color.
	TINT Adjustment By pressing and holding ◀ or ▶, you can change the tint.
	Bright Adjustment By pressing and holding ◀ or ▶, you can change the brightness.
	Contrast Adjustment By pressing and holding ◀ or ▶, you can change the contrast.
	(No function) Reserved.
 	Auto Tune Sensitivity Selection LO: Means the sensitivity of the TV is low. In this mode, the TV Tuner receives strong TV signals only. To set LO, press ◀. HI: Means the sensitivity of the TV is high (factory default). In this mode, the TV Tuner receives weak and strong TV signals. To set HI, press ▶.
 	Time On-Screen Message appears D3S: On-Screen Message appears for 3 seconds. To set D3S, press ◀. DON: On-Screen Message always appears. To set DON press ▶.

Power-on the TV Tuner: Use the ThinkPad Features program or PS2.EXE. to power-on the TV Tuner; then power-on the internal device in the diskette drive compartment.

Warning

If power for the internal device is turned off when the TV Tuner is set up, nothing appears on the LCD display. Turn on power for the TV Tuner again.

- If you are using DOS, do one of the following:
 - Power-on the computer and type PS2 from the command prompt to start the ThinkPad Features program.
Select **Set Power Features** from the ThinkPad Features menu; then put a check mark at **Internal Serial Port** (or **Diskette Drive Compartment**) under the **Power for devices**. If you need help, press **F1** to display the help menu.
 - Type PS2 MODEM ON (or PS2 DDC ON) from the command prompt; press the Enter key to set the power ON.
- If you are using OS/2* or Microsoft Windows**, do the following:
 1. Power-on the computer and start the ThinkPad Features program.
 2. Select the **Power** icon; then move the pointer to **Internal Serial Port** (or **Diskette Drive Compartment**) under the **Power for devices** and click the button to check mark it.
 3. Press the **OK** button.

* Trademark of the IBM Corporation.

** Trademark of Microsoft Corp.

Troubleshooting

The following table shows what to do to solve problems when the TV Tuner does not work correctly.

Problem	Probable Cause
The TV Tuner does not operate. (No picture or sound)	<ul style="list-style-type: none"> • Computer is not powered on. • Computer is in suspend mode. • Volume control of the TV Tuner or computer is not adjusted correctly. • The power for the TV Tuner is not supplied. (See "Power-on the TV Tuner" on page 480.) • The wall outlet from the outdoor antenna is not active. • The video or antenna cable is not connected correctly. • Antenna elements of the active antenna unit are not adjusted. • The batteries in the active antenna unit are not inserted correctly. • The batteries in the active antenna unit are depleted. • The TV Tuner is not set up correctly. • You cannot watch TV or videos on the external display. • LO is set for the auto tune sensitivity selection. (See page 479.)
No color.	<ul style="list-style-type: none"> • The program is not in color.
Snow and noise only.	<ul style="list-style-type: none"> • Switch the TV/EXT () button.
Pictures are out of shape, or have double images.	<p>For TV:</p> <ul style="list-style-type: none"> • The channel is not tuned correctly. • Adjust the antenna. <p>For VCR:</p> <ul style="list-style-type: none"> • Change the tracking adjustment.
Dotted lines or stripes.	<ul style="list-style-type: none"> • Usually caused by interference from neon signs, hair dryers, and so on. Move the computer to avoid the interference.
Picture control are not saved.	<ul style="list-style-type: none"> • Do not power-off the TV Tuner when adjusting functions such as picture control, color, tint, brightness, or contrast.
Channel number is always displayed or is not displayed.	<p>Select your favorite mode for the on-screen message. (See page 479.)</p>

Common Parts Listing

This section contains FRUs common to most IBM portable, laptop, and notebook computers.

External Diskette Drives

5.25-Inch Diskette Drive:	
360KB External (4869-001)	72X6759
360KB External (4869-501)	72X6768
1.2MB External (4869-002)	15X7993
1.2MB External (4869-502)	15X7994
5.25-Inch Drive Adapter	72X6757
5.25-Inch Drive Adapter/A	15F7996
5.25-Inch External Diskette Drive Cable (from system board to adapter)	27F4211
Diskette Drive Bus Adapter	72X8524

CD-ROM Drives

Enhanced Internal CD-ROM II Drive (With eject button below slot)	61G1901
Internal CD-ROM I Drive (eject button above slot)	81F7930
Terminator Kit (for 81F7930)	59F3530
Cleaning Kit (for 81F7930) (Disks, CD Caddy)	59F3562
Internal CD-ROM II Drive (With eject button below slot)	92F0084
Terminator Kit (for 92F0084)	92F0082
Media Kit (for 92F0084) (no cleaning necessary, Test Disk, CD Caddy)	31F4232
Signal Cable	34F0043
Power Cable	72X8521
Remote ID Switch Cable (3510)	92F0086
Audio Card, Cable, Screws (3510)	92F0085
CD Caddy	22F9419
Rail Kit (3510)	34F0041
Headphones	53F3610

SCSI Adapters, Terminators, Cables

SCSI Adapter/A (without Cache)	85F0002
SCSI Internal Cable	64F4127
SCSI Adapter/A (with Cache)	85F0063
Terminator, External (for 85F0063)	33F8464
Terminator, Internal (for 85F0063)	34F0025
Terminator, Internal (for 85F0002)	57F2870
SCSI Fast Adapter (16 bit)	92F0330
SCSI External Cable (for 92F0330)	32G4089
SCSI Internal Cable (for 92F0330)	32G0084
Terminator, Inline (space permitting)	92F0412

Rewritable Optical Drives

3.5-Inch Rewritable Optical Drive	92F0167
Rewritable Optical Cartridge	38F8647
Rewritable Optical Cartridge (5 Pack)	38F8646
Drive Mounting Slide (for 92F0167)	85F0022
Tray with Bezel (for 92F0167)	85F0021
Objective Lens Cleaner (for 92F0167)	38F8681
Prism Lens Cleaner (for 92F0167)	38F8682
3.5-Inch Enhanced Rewritable Optical Drive	92F0167
Mounting Tray	92F0269
Mounting Tray/Bezel (Model 3510)	92F0268

External Keyboard/Mouse

Keyboard Cable	72X8537
Mouse	61X8923
Mouse Ball and Pop-Off Retainer	33F8461
Mouse Ball and Twist-Off Retainer	33F8462
Mouse (New Style)	33G5420
Mouse Retainer Ring	33G5417
Miniature Mouse	95F5723

Enhanced Keyboards (101/102 Key)

220/240 V ac (So. Hemisphere)	07G4763
Tilt/Swivel Stand	38F3909

8516 Color Touch Display

110/120 V ac	44F9759
220/240 V ac (No. Hemisphere)	70F9129
220/240 V ac (So. Hemisphere)	70F9111

Miscellaneous Information

Acronyms, Abbreviations and Terms

Term	Information
ACPA/A	Audio Capture and Playback Adapter
ADP	Automatic Data Processing
Alt	Alternate
ANSI	American National Standards Institute
ARTIC	A Real Time Interface Coprocessor
ASCII	American National Standard Code for Interface Interchange
AT	Advanced Technology (as in AT Bus)
AVC	Audio Video Connection
BIOS	Basic Input/Output System (Controls System Resources)
bps	Bits Per Second
BPS	Bytes Per Second
CCITT	The International Telephone and Telegraph Consultative Committee
CCS	Common Command Set
CCSB	Common Complete Status Block
CCSB	Configuration Control Sub Board
CD	Compact Disc
CDPD	Cellular Digital Packet Data
CD-ROM	CD Read Only Memory (stores data/audio)
CE	Customer Engineer or Service Representative
CRC	Cyclic Redundancy Check
CRT	Cathode Ray Tube
CSD	Corrective Service Diskette
CGA	Color Graphics Adapter (See EGA, VGA, XGA)
CRC	Cyclic Redundancy Check
CRT	Cathode Ray Tube
CSA	Canadian Standards Association
CSD	Corrective Service Diskette
DASD	Direct Access Storage Device (hard disk, diskette)
DMA	Direct Memory Access
DRAM	Dynamic Random Access Memory
ECA	Engineering Change Announcement
ECC	Error Correction Code
EGA	Enhanced Graphics Adapter
ESD	Electrostatic Discharge
ESDI	Enhanced Small Device Interface
EEPROM	Electrically Erasable Programmable Read Only Memory
EWS	Energy Work Station
FRU	Field Replaceable Unit (replaceable part)
GPIB	General Purpose Interface Bus (IEEE 348)
GSA	General Services Administration
Ht	Height
IDE	Integrated Drive Electronics
IC	Integrated Circuit
IEEE	Institute of Electrical and Electronics Engineers
IEC	International Electrotechnical Commission
IML	Initial Machine Load
IPL	Initial Program Load
ISO	International Organization for Standardization
ISDN	Integrated-Services Digital Network

Term	Information
LAN	Local Area Network
LBA	Local Block Address
LTB	Local Transfer Bus
LUN	Logical Unit Number (as in SCSI)
MAP	Maintenance Analysis Procedure
MCGA	Modified Color Graphics Adapter (320 x 200 x 256)
MCA	Micro Channel Architecture (bus structure)
MHz	Mega hertz (millions of cycles per second)
MIDI	Musical Instrument Digital Interface
MM	Multimedia
N/A	Not Available or Not Applicable
NDD	National Distribution Division
NMI	Non-Maskable Interrupt
NSC	National Support Center
NVRAM	Non Volatile Random Access Memory
OEM	Original Equipment Manufacturer
PCMCIA	Personal Computer Memory Card International Association
POS	Programmable Option Select
PUN	Physical Unit Number (as in SCSI)
RAID	Redundant Array of Inexpensive Disks (disk array models)
RAM	Random Access Memory (read/write)
RGB	Red Green Blue (is in monitors)
RIPL	Remote Initial Program Load
ROM	Read Only Memory
SASD	Sequential Access Storage Device (Tape)
SCB	Subsystem Control Block
SCSI	Small Computer Systems Interface
SCSI ID	SCSI Identification Number (assigned device number)
SPD	Software Product Description
SR	Service Representative
SRAM	Static Random Access Memory
SVGA	Super Video Graphics Array
STN	Super Twisted Nematic
T/A	NDD Technical Advisor (See your Marketing Representative)
TDD	Telecommunications Device for the Deaf
TFT	Thin-Film Transistor
TPF	ThinkPad File
UL	Underwriters Laboratory
VCA	Video Capture Adapter
VESA	Video Electronics Standards Association
VGA	Video Graphics Array (640x480x16)
VPD	Vital Product Data
VRAM	Video Random Access Memory
WORM	Write Once, Read Many Media
XGA	Extended Graphics Array (1024 x 768 x 256)
Y/C	Luminance/Chrominance Signal (Pertains to Video)

Send Us Your Comments!

We want to know your opinion about this manual (part number 30H2357). Your input will help us to improve our publications.

Please photocopy this survey, complete it, and then fax it to **IBM HMM Survey at 919-543-8167 (USA)**.

Name _____

Phone Number _____

1. Do you like this manual?

- Yes No

2. What would you like to see added, changed, or deleted in this manual?

3. What is your service experience level?

- Less than five years
 More than five years

4. Which ThinkPad systems do you service most?

Thanks in advance for your response!

Do You Need Technical References?

We have a wide range of hardware technical references that provide in-depth information about IBM personal computer products. Our Technical Reference Library includes information about:

- Micro Channel, Setup, and Subsystem Control Block architectures
- Common interfaces (including microprocessors, system timers, parallel and serial port controllers, keyboards and keystrokes, SCSI, DMA, video, and more)
- Specific Personal System/2 systems (including system board connectors, jumpers, memory subsystems, I/O subsystems, programming interfaces and registers, and error codes)
- Basic input/output system (BIOS)
- Options and adapters

For a free catalog of our current offerings, please photocopy this form, complete it, and then fax it to **Hardware Technical References at 919-543-8167 (USA)**.

I'd like a catalog of the IBM PC Company Hardware Technical Reference library.

Problem Determination Tips

Due to the variety of hardware and software combinations that can be encountered, use the following information to assist you in problem determination. If possible, have this information available when requesting assistance from Service Support and Engineering functions.

- Machine type and model
- Processor or hard disk upgrades
- Failure symptom
 - Do diagnostics fail?
 - What, when, where, single, or multiple systems?
 - Is the failure repeatable?
 - Has this configuration ever worked?
 - If it has been working, what changes were made prior to it failing?
 - Is this the original reported failure?
- Reference Diskette Version
 - Type and revision level
- Hardware configuration
 - Print out (print screen) configuration from Reference Diskette currently in use
 - BIOS level
- Operating system software
 - Type and revision level

Important

To eliminate confusion, identical systems are considered *identical* only if they:

1. Are the exact machine type and models
2. Have the same BIOS level
3. Have the same adapters/attachments in the same locations
4. Have the same address jumpers/terminators/cabling
5. Have the same software versions and levels
6. Have the same Reference Diskette (version)
7. Have the same configuration options set in the system
8. Have the same setup for the operation system control files

Comparing the configuration and software set-up between “working and non-working” systems will often lead to problem resolution.

Phone Numbers, U.S. and Canada

Before you place a call to the Support Center, refer to "Problem Determination Tips" on page 493.
