Title & Document Type: 11848A Phase Noise Interface Service Manual

Manual Part Number: 11848-90004

Revision Date: June 1990

HP References in this Manual

This manual may contain references to HP or Hewlett-Packard. Please note that Hewlett-Packard's former test and measurement, semiconductor products and chemical analysis businesses are now part of Agilent Technologies. We have made no changes to this manual copy. The HP XXXX referred to in this document is now the Agilent XXXX. For example, model number HP8648A is now model number Agilent 8648A.

About this Manual

We've added this manual to the Agilent website in an effort to help you support your product. This manual provides the best information we could find. It may be incomplete or contain dated information, and the scan quality may not be ideal. If we find a better copy in the future, we will add it to the Agilent website.

Support for Your Product

Agilent no longer sells or supports this product. You will find any other available product information on the Agilent Test & Measurement website:

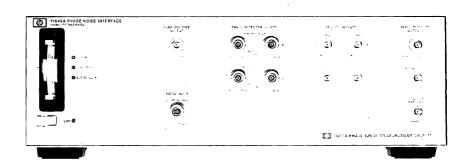

www.tm.agilent.com

Search for the model number of this product, and the resulting product page will guide you to any available information. Our service centers may be able to perform calibration if no repair parts are needed, but no other support from Agilent is available.

HP 11848A PHASE NOISE INTERFACE (Including Option 301)

Service Manual

SERIAL NUMBERS

This manual applies directly to instruments with serial numbers prefixed:

3138A and all MAJOR changes that apply to your instrument

rev.02NOV92

For additional important information about serial numbers, refer to "INSTRUMENTS COVERED BY THIS MANUAL" in Section 1.

Service Model 11848A

CHANGES

2749A and Above	On the A3 Component Locator:
·	• A3R208 - Change the reference designator of R208 to VR1.
	On the A3 Schematic:
	• A3R207, R208, R209 - Change the value of R207 to 1.33k. Change the value of R209 to 2.61k. Change the reference designator of R208 to VR1; connect the anode to ground. Connect the cathode to the line connecting R207 and pin 15 of U208.
3138A and Above	On the A3 Schematic:
	Change the board number to 11848-60203.

T Y	
All serial prefixes	 On the A3 schematic: R36 - Change the value of R36 to 261K ohms. R41, R42, R51, R52 - Under 1 kHz LOW-PASS FILTER change R41 26.1K to R51 2.61K and change R42 4.22K to R52 422K. R41, R42, R56, R57 - Under 10 kHz LOW-PASS FILTER change R41 26.1K to R56 2.61K and change R42 4.22K to R57 422K. C34, R61 - Under AC/DC ADAPTIVE COUPLER locate U15 pin 13 and add R61 251K in series with the +5V supply. Add C34 15 uF between U15 pin 13 and R61. R76, R82 - Under 10 Hz HIGH-PASS FILTER connect R76 to R79. Under 100 Hz HIGH-PASS FILTER connect R82 to R85.
3138A and Above	On the A3 Schematic: • Change the board number to 11848-60203.

CHANGES

All serial prefixes	On the A4 schematic: • C14 - In OVERLOAD DETECTOR, change the value of C14 to 18pF.
2830A and above	 On the schematic: L15 - In the upper right hand corner of the A4b schematic change the value of L15 to 100UH. R35 - In the upper right hand corner of the A4b schematic change the value of R35 to 2.15K ohm.
Errata	On the A4 Schematic: • C230 - Under PROGRAMMABLE AMPLIFIERS, near TP201, change the value of C230 to 6800pF. • R201 - Under PROGRAMMABLE AMPLIFIERS, near TP201, change the value of R201 to 287Ω.

Reserved for future changes.

Microfiche Service Manual HP Part 11848-90011

Printed in U.S.A. : MAY 1990

ACCESSORIES SUPPLIED

The accessories supplied are pieces of equipment that are shipped with every Interface. The accessories are shown in Figure 1.

Line Power Cable. The line power cable may be supplied in several plug configurations, depending on the destination of the original shipment. Refer to *Power Cables* in the *Installation* section of this *Service* manual.

Fuses. Fuses with a 0.75A rating for 115 Vac (HP part number 2110-0063) and a 0.5A rating for 230 Vac (HP part number 2110-0012) are supplied. One fuse is factory installed according to the voltage available in the country of original destination. Refer to *Power Requirements* in the *Installation* of this *Service* manual.

HP 3048A Option 301 Software and Manual Set. The HP 3048A software and associated manuals are shipped with the Interface.

HP 3048A Software (HP part number 03048-10015).

HP 11848A Service Manual (HP part number 11848-90004).

HP 3048A Option 301 Installation Guide (HP part number 03048-90043).

HP 3048A Option 301 Operating Manual (HP part number 03048-90042).

HP 3048A Option 301 System Calibration Manual (HP part number 03048-90041).

HP 3048A Option 301 Reference Manual (HP part number 03048-90040).

50 Ω **Termination**. This 50 Ω load is used to terminate the Interface's Spectrum Analyzer output if no RF spectrum analyzer is available (HP part number 1250-0207).

Adapters, **Type-N to BNC**. Three adapters are provided for system operation (HP part number 1250-0780).

Cable Assemblies: BNC. Two 30 cm (12 in.) cables are provided for system operation (HP part number 8120-1838).

Noise Floor Test Fixture. This test fixture is used to run performance tests (HP part number 11848-61032).

Cable Assembly: BNC to SMB. This cable assembly can be used during troubleshooting (HP part number 08954-60105).

rev.10JAN91 22.5

RECOMMENDED TEST EQUIPMENT

Table 1 lists the test equipment and accessories recommended for use in testing, adjusting, and servicing the Interface. If any of the recommended equipment is unavailable, instruments with equivalent minimum specifications may be substituted.

Tests for the Interface are performed during the HP 3048A Performance Tests which are available in the HP 3048A Option 301 System Calibration Manual in Performance Tests.

Instrument Type	Model Number	Use*
Dynamic Signal Analyzer Counter (550 MHz) Function Generator Oscilloscope Power Meter and Sensor	HP 3561A HP 5383A, HP 5386A HP 3312A, HP 3325A HP 1740A HP 435B or HP 436A with HP 8481A or HP 8482A	A,C,P,T ** P P,T T

Table 1. Recommended Test Equipment

OPTIONS AVAILABLE

Options are variations on the standard instrument which can be ordered during the purchase.

Electrical Options

Option 201: Add High Frequency Phase Detector. This option adds a 1.2 to 18 GHz phase detector to the Interface. This phase detector extends the range of carrier frequencies that can be demodulated within the Interface without external down conversion by the System. All of the HP 3048A specifications from 1.6 to 18 GHz carrier frequency are valid with this option.

Mechanical Options

Option 907: Front-Handle Kit. Front handles are provided when Option 907 is ordered. After shipment, you can order a Front-Handle Kit as HP part number 5061-9689.

Option 908: Rack-Flange Kit. Rack flanges are provided for the HP 11848A Phase Noise Interface when Option 908 is ordered. After shipment, you can order a Rack-Flange Kit as HP part number 5061-9677.

Option 909: Rack-Flange and Front-Handle Combination Kit. This is not a Front-Handle Kit and a Rack-Flange Kit packaged together; it is a unique part that combines both functions. Combination kits are provided for the HP 11848A Phase Noise Interface when Option 909 is ordered. After shipment, you can order a Rack-Flange and Front-Handle Combination Kit as HP part number 5061-9683.

^{*} A = Adjustments, C = Functional Checks, P = Performance Tests, T = Troubleshooting

^{**} The HP 3561A is included with the HP 3048A system.

Model 11848A Replaceable Parts

Table 7. Update Information for Instrument Changes

Reference Designator	Serial Prefix	Description of Change
A1S1, A1S2, A1S3	2720A	Instruments with serial prefixes prior to 2720A have components A1S1, A1S2 and A1S3 installed. These switches are not used, and if improperly set can cause the instrument to malfunction. Any or all of the switches may be removed without affecting the operation of the instrument. These switches are not loaded in instruments with serial prefixes 2720A and above.
MP2, MP4-MP11, MP13, MP15	2924A	CABINET PARTS COLOR CHANGE Serial Prefix 2924A changes color of the instrument covers and accessories. The old color cover and accessories are no longer available. If your instrument has serial prefixes 2830A and below, and you must replace one of these parts, we recommend that you order the full set of covers and accessories. See table 5.
J1	All Prefixes	The voltage output from the rear panelat J1 is the opposite polarity of the front panel voltage. Silk screening has been added to the rear panel "Tune Voltage Output" which reads: "Caution: Inverted Output".

Model 11848A Schematic Notes

Table 9. Cross Reference Index

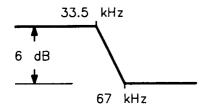

Reference Designator	Assembly Name	Schematic Service Sheet Number	Parts List Page No.
A1	HP-IB Interfacing/Power Supply Assembly	A1a, A1b	27
A2	LED Assembly	A4b	30
А3	Analyzer Interface Assembly	A3a, A3b, A3c	31
A4	Phase Detector Assembly	A4a, A4b, A4c, A4d	39
A5	Not Assigned		
A6	10 MHz VCXO A Assembly	A6	51
A7	10 MHz Modulated VCXO B Assembly	A7	54
A8	350-500 MHz VCO Assembly	A8	57
A9	400 MHz Oscillator Assembly	A9	59
A10	Line Power Module	A1b	61
A11	HP-IB Connector Assembly	A1a	62
A12	LNA2 Assembly	A12	62.1

Table 10. Factory Selected Components

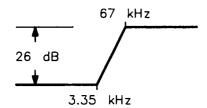

Reference	Service	Range of	Basis of Selection
Designator	Sheet	Values	
A12C17	A12	4.7pF to 22pF	Selected to provide optimum flatness in the X5 gain function of LNA2. Increase the value of C17 to provide more gain, and decrease peaking, at the high end (40 MHz) of the amplifier output. Decrease the value of C17 to compensate for excess roll-off at the high end. This will have little or no effect at the low end (<10 MHz). The input and output of LNA2 should be isolated from the 11848A signal paths to observe the most evident changes.

rev.09OCT90 89

- Switches on the Block Diagram are shown in their HP-IB preset state. At Interface turn-on with no controller connected, the power-up state is the same as the HP-IB preset state except:
 - a. ATTEN 1 is set to an open-circuit (non-programmable) state, and
 - b. the switches of cluster S5 through S8 are all open.
- 2. The transfer function of GAIN 2 also has a lead-lag response as follows:

3. The transfer function of Lag-Lead Network 1 is as follows:

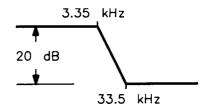

To this transfer function is added a programmable lag-lead with the following poles and zeros:

Lag-Lead Number	Pole Frequency	Zero Frequency	Attenuation
0	4.82 Hz	9.95 Hz	6 dB
1 1	8.01 Hz	40.1 Hz	14 dB
2	9.17 Hz	115.9 Hz	22 dB
3	9.68 Hz	306 Hz	30 dB
4	9.95 Hz	784 Hz	38 dB
5	9.95 Hz	1.985 kHz	46 dB
6	9.95 Hz	5.00 kHz	54 dB
7	9.95 Hz	12.58 kHz	62 dB

Assemblies A6, A8, and A9 are controlled as follows:

O-minal I in a		State	
Control Line	A6	A8	Α9
L17 L18 L17, L18	Off Off On	On On Off	On Off Off

The transfer functions of Lag-Lead Network 2 on A4 and the Lag-Lead Network on A3 are both as follows:

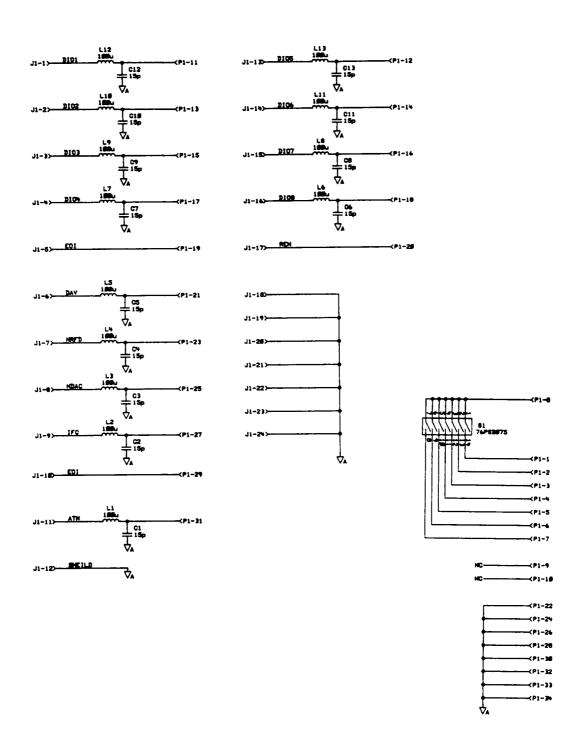

6. The passband gain of the High-Pass Filters is 2 (as measured from TP17 to the respective filter output). The gain settings of the GAIN 3 amplifier and attenuator include the passband gain of the High-Pass Filters. Service Model 11848A

All Serial Prefixes	On the A1 Component Locator:
	• A1S1, S2, S3 - Delete S1, S2 and S3. At serial prefix 2720A, A1S1, S2 and S3 were removed. These switches are not used (open) and could cause the instrument to fail or malfuntion if improperly set. Any or all of the switches may be removed without affecting the operation of the instrument.
	On the A1 Schematic:
	• A1S1, S2, S3 - Delete S1, S2 and S3. At serial prefix 2720A, A1S1, S2 and S3 were removed. These switches are not used (open) and could cause the instrument to fail or malfuntion if improperly set. Any or all of the switches may be removed without affecting the operation of the instrument.
3040A and above	On the Schematic:
	• A11 - Use the new schematic on page 92.3 for all references to the HP-IB Connector Assembly.
	On the Component Locator:
	• A11 - Use the new component locator on page 92.4 for all references to the HP-IB Connector Assembly.

CERTIFICATION

Hewlett-Packard Company certifies that this product met its published specifications at the time of shipment from the factory. Hewlett-Packard further certifies that its calibration measurements are traceable to the United States National Bureau of Standards, to the extent allowed by the Bureau's calibration facility, and to the calibration facilities of other International Standards Organization members.

WARRANTY

This Hewlett-Packard instrument product is warranted against defects in material and workmanship for a period of one year from date of shipment. During the warranty period, Hewlett-Packard Company will at its option, either repair or replace products which prove to be defective.

For warranty service or repair, this product must be returned to a service facility designated by HP. Buyer shall prepay shipping charges to HP and HP shall pay shipping charges to return the product to Buyer. However, Buyer shall pay all shipping charges, duties, and taxes for products returned to HP from another country.

HP warrants that its software and firmware designated by HP for use with an instrument will execute its programming instructions when properly installed on that instrument. HP does not warrant that the operation of the instrument, or software, or firmware will be uninterrupted or error free.

LIMITATION OF WARRANTY

The foregoing warranty shall not apply to defects resulting from improper or inadequate maintenance by Buyer, Buyer-supplied software or interfacing, unauthorized modification or misuse, operation outside of the environmental specifications for the product, or improper site preparation or maintenance.

NO OTHER WARRANTY IS EXPRESSED OR IMPLIED. HP SPECIFICALLY DISCLAIMS THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

EXCLUSIVE REMEDIES

THE REMEDIES PROVIDED HEREIN ARE BUYER'S SOLE AND EXCLUSIVE REMEDIES. HP SHALL NOT BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES, WHETHER BASED ON CONTRACT, TORT, OR ANY OTHER LEGAL THEORY.

ASSISTANCE

Product maintenance agreements and other customer assistance agreements are available for Hewlett-Packard products.

For any assistance, contact your nearest Hewlett-Packard Sales and Service Office. Addresses are provided at the back of this manual.

SAFETY CONSIDERATIONS

GENERAL

This product and related documentation must be reviewed for familiarization with safety markings and instructions before operation.

This product is a Safety Class I instrument (provided with a protective earth terminal).

BEFORE APPLYING POWER

Verify that the product is set to match the available line voltage and the correct fuse is installed.

SAFETY EARTH GROUND

An uninterruptible safety earth ground must be provided from the main power source to the product input wiring terminals, power cord, or supplied power cord set.

SAFETY SYMBOLS

Instruction manual symbol: the product will be marked with this symbol when it is necessary for the user to refer to the instruction manual (refer to Table of Contents).

Indicates hazardous voltages.

Indicates earth (ground) terminal.

WARNING The WARNING sign denotes a hazard. It calls attention to a procedure, practice, or the like, which, if not correctly performed or adhered to, could result in personal injury. Do not proceed beyond a WARNING sign until the indicated conditions are fully understood and met.

The CAUTION sign denotes a hazard. It calls attention to an operating procedure, practice, or the like, which, if not correctly performed or adhered to, could result in damage to or destruction of part or all of the product. Do not proceed beyond a CAUTION sign until the indicated conditions are fully understood and met.

WARNING

Any interruption of the protective (grounding) conductor (inside or outside the instrument) or disconnecting the protective earth terminal will cause a potential shock hazard that could result in personal injury. (Grounding one conductor of a two conductor outlet is not sufficient protection).

Whenever it is likely that the protection has been impaired, the instrument must be made inoperative and be secured against any unintended operation.

If this instrument is to be energized via an autotransformer (for voltage reduction) make sure the common terminal is connected to the earth terminal of the power source.

Servicing instructions are for use by servicetrained personnel only. To avoid dangerous electric shock, do not perform any servicing unless qualified to do so.

Adjustments described in the manual are performed with power supplied to the instrument while protective covers are removed. Energy available at many points may, if contacted, result in personal injury.

Capacitors inside the instrument may still be charged even if the instrument has been disconnected from its source of supply.

For continued protection against fire hazard, replace the line fuse(s) only with 250V fuse(s) of the same current rating and type (for example, normal blow, time delay, etc.). Do not use repaired fuses or short circuited fuseholders.

ATTENTION Static Sensitive Devices

This instrument was constructed in an ESD (electro-static discharge) protected environment. This is because most of the semiconductor devices used in this instrument are susceptible to damage by static discharge.

Depending on the magnitude of the charge, device substrates can be punctured or destroyed by contact or mere proximity of a static charge. The results can cause degradation of device performance, early failure, or immediate destruction.

These charges are generated in numerous ways such as simple contact, separation of materials, and normal motions of persons working with static sensitive devices.

When handling or servicing equipment containing static sensitive devices, adequate precautions must be taken to prevent device damage or destruction.

Only those who are thoroughly familiar with industry accepted techniques for handling static sensitive devices should attempt to service circuitry with these devices.

In all instances, measures must be taken to prevent static charge build-up on work surfaces and persons handling the devices.

For further information on ESD precautions, refer to "SPECIAL HANDLING CONSIDERATIONS FOR STATIC SENSITIVE DEVICES" in Section VIII Service Section.

Model 11848A General Information

General Information

INTRODUCTION

This Service Manual contains information for installation of the Hewlett-Packard Model 11848A Phase Noise Interface.

The HP 11848A is the Phase Noise Interface for the HP 3048A Phase Noise Measurement System. The Interface supports several measurement techniques for phase noise and AM noise measurements. Inside the Interface are the phase detectors, amplifiers, filters, and switches necessary to measure phase noise over a frequency range of 5 MHz to 18 GHz. An input for an external phase detector outside that frequency range is also provided. The built-in sources allow the system to functionally check all of its signal handling circuits to insure proper operation before measurements are made.

INSTRUMENTS COVERED BY THIS MANUAL

Attached to the instrument is a serial number plate. The serial number is in the form 1234A00123. The first four digits and the letter are the serial prefix. The last five digits form the sequential suffix that is unique to each instrument.

SPECIFICATIONS

The specifications for the Interface are included in the specifications for the HP 3048A Phase Noise Measurement System which specifies the entire system. There are no specifications that apply to the Interface alone.

PERFORMANCE TESTS

The performance Tests for the Interface are included in the performance tests for the HP 3048A Phase Noise Measurement System. These tests can be found in the HP 3048A System Calibration Manual.

It is not necessary to run the System performance tests after the System is initially installed. These tests are performed at the factory before shipment. However, performance tests should be run every 12 months or whenever the Interface has been repaired.

CALIBRATION

The calibration of the Interface consists of generating correction factors for the various measurement paths and storing them on the software disc for corrections of 0 Hz to 100 kHz as CALDATALO and 100 kHz to 40 MHz as CALDATAHI. Stored with CALDATAHI are the nominal voltages (VNOMs) to set each internal source to its nominal frequency.

The calibration of the Interface is only part of the calibration of the HP 3048A Phase Noise Measurement System and must be done with the System. For calibration refer to the HP 3048A Phase Noise Measurement System Calibration Manual.

rev.30MAY89

General Information Model 11848A

The complete calibration for a HP 3048A Phase Noise Measurement System includes the following:

- 1. HP 3561A Dynamic Signal Analyzer bench calibration.
- 2. RF Analyzer bench calibration. (If an RF analyzer is configured in the system.)
- 3. HP 3048A Functional Checks.
- 4. HP 11848A Adjustments. (The adjustments should only be run if the Functional Checks show a problem.)
- 5. HP 3048A System Calibration Option 2. (This is total calibration of the HP 11848A Interface's measurement paths.)
- 6. HP 3048A Performance Tests.

Before calibrating the System, the HP 3561A Dynamic Signal Analyzer and any configured RF analyzer should be separately bench calibrated if they are beyond their calibration period.

NOTE

Measurement of phase noise is a ratio measurement where both the numerator (the noise power) and the denominator (the carrier's power) of the ratio are measured by the same system spectrum analyzer(s). The accuracy of this relative measurement depends on the amplitude linearity of the spectrum analyzer. A precision attenuator is used, in turn, to verify the linearity specification of the spectrum analyzer. The amplitude linearity calibration of the spectrum analyzer will be traceable to the National Bureau of Standards (NBS) if the precision attenuator and other instrumentation used to perform the calibration is traceable to NBS.

The following are guidelines as to when the Interface hardware calibration and System performance tests should be run:

- It is not necessary to calibrate the Interface after the System is initially installed. The calibration procedure is done at the factory before shipment, and the unique calibration data for the Interface is stored on a software disc. This disc is included within the software set shipped with your Interface.
- Whenever the environment changes 10°C or more, Option 1 calibration should be run to generate new calibration data for the Interface to ensure accurate System performance.
- Once a year, after a repair of the Interface, or when a problem is suspected in the Interface the following test should be run to ensure accurate System measurement results:
 - a. Functional Checks.
 - b. Adjustments. (The adjustments should only be run if the Functional Checks show a problem.)
 - c. Calibration Option 2. (This is a total calibration of the Interface measurement paths.)
 - d. Performance Tests.

The performance tests can be run more often if desired to ensure that the system meets the published specifications contained in Section 1 of the HP 3048A Operating Manual.

It is suggested that the performance test be run in the following order:

- 1. Spur Accuracy Performance Test (spurious signal).
- 2. Noise Flatness Performance Test. (This test need only be run if an RF analyzer is included in the system configuration.)
- 3. Noise Floor Performance Test.

Model 11848A General Information

DOCUMENTATION UPDATING

An instrument manufactured after the printing of these manuals may have a serial-number prefix that is not listed on the manual title page. Having a serial-number prefix that is greater than that shown on the title page indicates that the instrument is slightly different from those documented in the manual. In this case, your manual may be provided with updating information to make it as current as possible. This updating information contains all major change information that applies to instruments beyond the serial-prefix range defined on the title page. Minor changes may not be included but will be covered in subsequent updates you can receive by joining the Documentation Update Service.

A Description of the Manual Update Packet

A Manual Update packet consists of replacement and addition pages which should be incorporated in your manual to bring it up to date. (An addition page results when new information won't fit on a replacement page.)

Signing Up for the Documentation Update Service

Hewlett-Packard offers a Documentation Update Service that will provide you with further updates and changes as they become available. If you have not received update information that matches the serial number of your instrument, you can receive this information through the Update Service.

If you operate or service instruments with different serial prefixes, we strongly recommend that you join this service immediately to ensure that your manual is kept current.

For more information, refer to the Documentation Update Service reply card included in this manual or contact:

Hewlett-Packard Company Technical Writing Department 24001 E. Mission-TAF C-34 Spokane, WA 99220 (509) 922-4001

Also, if you join the update service, you can indicate whether you choose to be contacted in the future about the quality of the documentation you receive. We are constantly trying to provide the best documentation possible and periodically survey our customers as to their expectations and the usability of the manuals we provide.

SAFETY CONSIDERATIONS

The Interface is a Safety Class I instrument (that is, provided with a protective earth terminal). Before operation, look over the Phase Noise Interface and its related documentation to get familiar with safety markings and instructions. Refer to the Safety Considerations page found at the beginning of this manual for a summary of the safety information. Safety information that applies to the specific task at hand (for example, installation) is found in this manual.

General Information Model 11848A

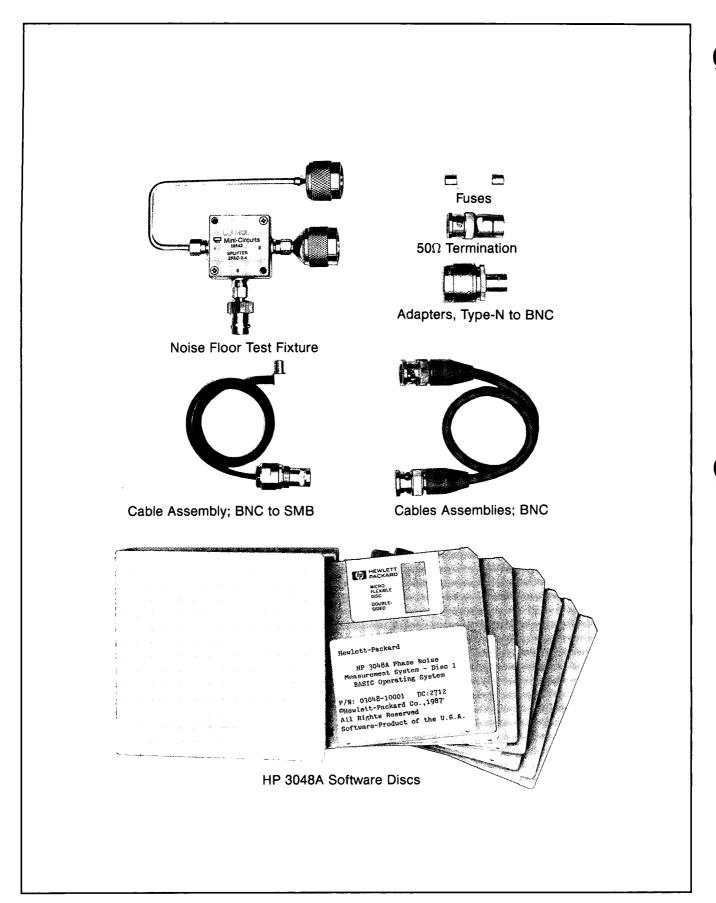

Figure 1. Accessories Supplied

Model 11848A General Information

ACCESSORIES SUPPLIED

The accessories supplied are pieces of equipment that are shipped with every Interface. The accessories are shown in Figure 1.

Line Power Cable. The line power cable may be supplied in several plug configurations, depending on the destination of the original shipment. Refer to *Power Cables* in the *Installation* section of this *Service* manual.

Fuses. Fuses with a 0.75A rating for 115 Vac (HP part number 2110-0063) and a 0.5A rating for 230 Vac (HP part number 2110-0012) are supplied. One fuse is factory installed according to the voltage available in the country of original destination. Refer to *Power Requirements* in the *Installation* of this *Service* manual.

HP 3048A Software Discs and Manual Set. The HP 3048A software set and associated manuals are shipped with the Interface.

HP 3048A Software Set (HP part number 11848-61026).

HP 11848A Service Manual (HP part number 11848-90004).

HP 3048A Operating Manual (HP part number 03048-90001).

HP 3048A Reference Manual (HP part number 03048-90002).

50 Ω **Termination.** This 50 Ω load is used to terminate the Interface's Spectrum Analyzer output if no RF spectrum analyzer is available (HP part number 1250-0207).

Adapters, Type-N to BNC. Three adapters are provided for system operation (HP part number 1250-0780).

Cable Assemblies: BNC. Two 30 cm (12 in.) cables are provided for system operation (HP part number 8120-1838).

Noise Floor Test Fixture. This test fixture is used to run performance tests (HP part number 11848-61032).

Cable Assembly: BNC to SMB. This cable assembly can be used during troubleshooting (HP part number 08954-60105).

General Information Model 11848A

RECOMMENDED TEST EQUIPMENT

Table 1 lists the test equipment and accessories recommended for use in testing, adjusting, and servicing the Interface. If any of the recommended equipment is unavailable, instruments with equivalent minimum specifications may be substituted.

Tests for the Interface are performed during the HP 3048A Performance Tests which are available in the HP 3048A Operating Manual in Appendix B, Performance Tests.

Instrument Type	Model Number	Use*	
Dynamic Signal Analyzer	HP 3561A	A,C,P,T **	
Counter (550 MHz)	HP 5383A, HP 5386A	Р	
Function Generator	HP 3312A, HP 3325A	P,T	
Oscilloscope	HP 1740A	Т	
Power Meter and Sensor	HP 435B or HP 436A with	Т Т	
	HP 8481A or HP 8482A		

Table 1. Recommended Test Equipment

OPTIONS AVAILABLE

Options are variations on the standard instrument which can be ordered during the purchase.

Electrical Options

Option 201: Add High Frequency Phase Detector. This option adds a 1.2 to 18 GHz phase detector to the Interface. This phase detector extends the range of carrier frequencies that can be demodulated within the Interface without external down conversion by the System. All of the HP 3048A specifications from 1.6 to 18 GHz carrier frequency are valid with this option.

Mechanical Options

Option 907: Front-Handle Kit. Front handles are provided when Option 907 is ordered. After shipment, you can order a Front-Handle Kit as HP part number 5061-9689.

Option 908: Rack-Flange Kit. Rack flanges are provided for the HP 11848A Phase Noise Interface when Option 908 is ordered. After shipment, you can order a Rack-Flange Kit as HP part number 5061-9677.

Option 909: Rack-Flange and Front-Handle Combination Kit. This is not a Front-Handle Kit and a Rack-Flange Kit packaged together; it is a unique part that combines both functions. Combination kits are provided for the HP 11848A Phase Noise Interface when Option 909 is ordered. After shipment, you can order a Rack-Flange and Front-Handle Combination Kit as HP part number 5061-9683.

 $^{^{\}star}$ A=Adjustments, C=Functional Checks, P=Performance Tests, T=Troubleshooting

^{**} The HP 3561A is included with the HP 3048A system.

Model 11848A Installation

INSTALLATION

INTRODUCTION

This section provides the information needed to install the HP 11848A Phase Noise Interface. Included is information pertinent to initial inspection, power requirements, line voltage selection, power cables, environment, storage, and shipment.

INITIAL INSPECTION

WARNING

To avoid hazardous electrical shock, do not perform electrical tests when there are signs of shipping damage to any portion of the outer enclosure (covers and panels).

Inspect the shipping container for damage. If the shipping container or cushioning material is damaged, it should be kept until the contents of the shipment have been checked for completeness and the instrument has been checked mechanically and electrically. Procedures for checking electrical performance are given in the Confidence Check found in the HP 3048A Operating Manual. If the contents are incomplete, if there is mechanical damage or defect, or if the instrument does not pass the electrical performance test, notify the nearest Hewlett-Packard office. If the shipping container is damaged, or the cushioning material shows signs of stress, notify the carrier as well as the Hewlett-Packard office. Keep the shipping materials for the carrier's inspection.

PREPARATION FOR USE

Power Requirements

The HP 11848A requires a power source of 100 Vac (90 to 105 Vac), 120 Vac (108 to 126 Vac), 220 Vac (198 to 231 Vac), or 240 Vac (216 to 252 Vac), 47.5 to 440 Hz single phase. Power consumption is 260 VA maximum.

WARNING

This is a Safety Class I product (i.e., provided with a protective earth terminal). An uninterrupted safety earth ground must be provided from the Mains power source to the product input wiring terminals, power cord, or supplied power cord set. Whenever it is likely that the protection has been impaired, the instrument must be made inoperative and be secured against any unintended operation.

If this instrument is to be energized via an external autotransformer for voltage reduction, make sure that the common terminal is connected to the earth pole of the power source.

CAUTION

BEFORE PLUGGING THIS INSTRUMENT into the Mains (line) voltage, be sure the correct voltage and fuse have been selected.

Installation Model 11848A

A rear-panel, line power module permits operation from 100, 120, 220, or 240 Vac. The number visible in the window (located on the module) indicates the nominal line voltage to which the instrument must be connected. Verify that the line voltage selection and the fuse are matched to the power source. Refer to Figure 2, Line Voltage and Fuse Selection.

Two fuses are supplied with each instrument. One fuse has the proper rating for 110/120 Vac line operation (HP part number 2110-0063; 0.75A, 250V, non-time-delay). The other fuse is rated for 200/220 Vac operation (HP part number 2110-0012; 0.5A, 250V, non-time-delay).

One fuse is installed in the instrument at the time of shipment. The rating of the installed fuse is selected according to the line voltage specified by the customer. If the voltage is not specified, the rating of the installed fuse will be selected according to the country of destination.

WARNING

For protection against fire hazard, the line fuse should only be a 250V normal blow fuse with the correct current rating.

Power Cables

WARNING

BEFORE CONNECTING THIS INSTRUMENT, the protective earth terminal of the instrument must be connected to the protective conductor of the (mains) power cord. The mains plug shall only be inserted in a socket outlet provided with a protective earth contact. The protective action must not be negated by the use of an extension cord (power cable) without a protective conductor (grounding). Grounding one conductor of a two conductor outlet is not sufficient protection.

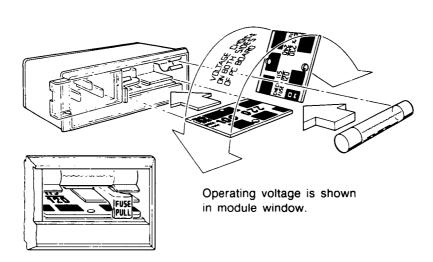

This instrument is equipped with a three-wire power cable. When connected to an appropriate ac power receptacle, this cable grounds the instrument cabinet. The type of power cable plug shipped with each instrument depends on the country of destination. Refer to Table 2 on for the part numbers of the power cables and Mains plugs available.

Mating Connectors

Coaxial Connectors. Coaxial mating connectors used with the Phase Noise Interface should be either the 50-ohm BNC male connectors or 50-ohm Type-N male connectors that are compatible with those specified in US MIL-C-39012.

The application note, "Principles of Microwave Connector Care" (HP part number 5958-7442) can help you improve measurements and reliability. Suggestions in the application note will help you get the best performance from all microwave connectors. It will show what to look for when cleaning and inspecting connectors (in order to preserve their precision and extend their life) and how to make the best possible microwave connections (improving the accuracy and repeatability of all your measurements).

Model 11848A Installation

Selection of Operating Voltage and Fuse Replacement

- 1. Open cover door, pull the FUSE PULL lever and rotate to left. Remove the fuse.
- 2. Remove the Line Voltage Selection Card. Position the card so the line voltage appears at top-left corner. Push the card firmly into the slot.
- 3. Rotate the FUSE PULL lever to its normal position. Insert a fuse of the correct value in the holder. Close the cover door.

Figure 2. Line Voltage and Fuse Selection

Operating Environment

The operating environment should be within the following limitations:

Temperature	0°C to +55°C
Humidity	. 5% to 95% (maximum wet bulb temperature = 40°C)
Altitude	
Airflow	. 5.8 mm (0.23 in.) minimum clearance underneath the
	instrument and sufficient clearance behind the
	instrument for air flow that is not obstructed

Rack Mounting

Rack mounting information is provided with the rack mounting kit. If the kit was not ordered with the instrument as an option, it may be ordered through the nearest Hewlett-Packard office. For rack-mount kit part numbers, refer to *Mechanical Options* in the *General Information* section of this manual.

Model 11848A Installation

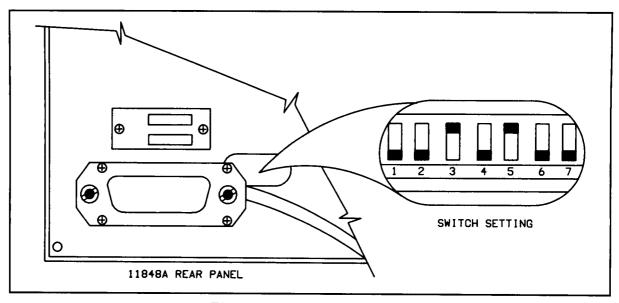

Figure 3. HP-IB Address Switch

HP-IB Address Selection

The HP-IB address is selectable using rocker switches on the rear-panel of the Phase Noise Interface. These rocker switches are set up in a binary format with switch number 1 as the least significant digit and switch number 5 as the most significant digit. (Switches 6 and 7 are not used.) Any one of 31 HP-IB addresses can be set (00 through 30).

The address of the HP 11848A is set to 20 at the factory (switches 3 and 5 high; 16 + 4 = 20). Refer to Figure 3.

STORAGE AND SHIPMENT

Environment

The instrument should be stored in a clean, dry environment. The following environmental limitations apply to both storage and shipment:

Temperature	-55° C to $+75^{\circ}$ C
	. 5% to 95% (maximum wet-bulb temperature = 40° C)
Altitude	

Packaging

Original Packaging. Containers and materials identical to those used in factory packaging are available through Hewlett-Packard offices. If the instrument is being returned to Hewlett-Packard for servicing, attach a tag indicating the type of service required, return address, model number, and full serial number. Also mark the container FRAGILE to assure careful handling. In any correspondence refer to the instrument by model number and full serial number.

Installation Model 11848A

Other Packaging. The following general instructions should be used for repackaging with commercially available materials:

- 1. Wrap the instrument in heavy paper or plastic. (If shipping to a Hewlett-Packard office or service center, attach a tag indicating the service required, return address, model number, and full serial number.)
- 2. Use a strong shipping container. A double wall carton made of 2.4 MPa (350 psi) test material is adequate.
- 3. Use enough shock-absorbing material (75 to 100 mm layer; 3 to 4 in.) around all sides of the instrument to provide firm cushion and prevent movement in the container. Protect the front panel with cardboard.
- 4. Seal the shipping container securely.
- 5. Mark the shipping container FRAGILE to ensure careful handling.

Model 11848A Service

Principles of Operation for the Block Diagram

General

The HP 11848A Phase Noise Interface is the central instrument in the HP 3048A Phase Noise Measurement System. It is a collection of circuits configured under computer control to make accurate phase-noise measurements on a wide variety of devices-under-test and using several test methods. Besides the Interface, the System includes:

- a Fast-Fourier-Transform (FFT) spectrum analyzer (the HP 3561A Dynamic Signal Analyzer) that measures the demodulated phase noise as a function of frequency offset from the carrier,
- optionally, an additional RF spectrum analyzer that extends the frequency-offset measurement range,
- optionally, reference sources with high spectral purity, and
- the system controller.

Some of the interface circuits in the HP 11848A Phase Noise Interface include:

- numerous signal-routing switches,
- an RF phase detector and optionally a microwave phase detector (1) for demodulation of phase noise to be measured by the spectrum analyzers and (2) to provide a tune voltage to phase lock the input sources in quadrature when the phase-noise-using-a-phase-lock-loop method is used,
- · various networks which process the phase detector output for voltage control of the input sources,
- various networks which process the noise for measurement by the spectrum analyzer,
- detectors which sense erroneous measurement conditions.
- four RF sources for system calibration verification, and
- control circuits which interface with the controller via HP-IB.

The maximum frequency offset from the carrier that can be measured by the system is 100 kHz for the standard system and 40 MHz with an additional RF spectrum analyzer (such as the HP 3585A) supported by the system.

NOTE

In the text that follows, the primary discussion of a functional circuit is indicated by lettering the circuit description in boldface, for example, RF Phase Detector. The term "Interface" refers to the HP 11848A Phase Noise Interface; "System" refers to the HP 3048A Phase Noise Measurement System. An RF spectrum analyzer is assumed to be connected to the System.

Measurement Modes

To clearly understand the functions of the Interface, it is helpful to see the relationship of the Interface to the other System instruments and the device-under-test in a phase noise measurement. Refer to Figure 4.

Figure 4 shows the most basic measurement mode where the noise on the source has been demodulated externally and fed into the front-panel NOISE INPUT. In this mode of operation the Interface serves mainly to condition (amplify and filter) the noise. The conditioned noise is then measured (in the frequency domain) by the spectrum analyzers. The measured noise is then analyzed, mathematically manipulated, and plotted by the controller. The noise need not be exclusively phase noise; it could also be AM (from an AM detector), FM (from an FM discriminator), or baseband (0.01 Hz to 40 MHz) noise.

Service Model 11848A

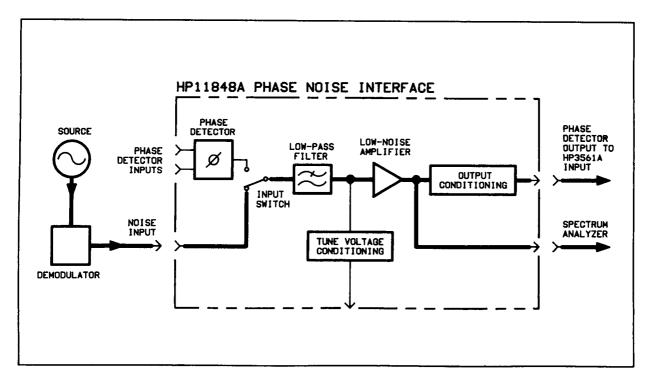

Figure 4. Noise Measurement with an External Demodulator

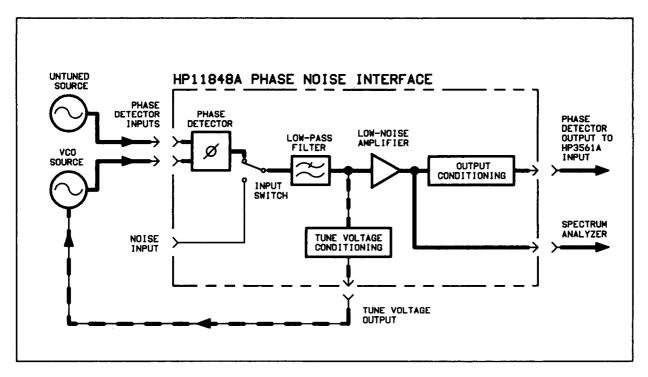

Figure 5. Noise Measurement with the Internal Phase Demodulator

Model 11848A Service

In the diagram, the Low-Pass Filter removes carrier-related signals to reject them from the circuits that follow. The Low-Noise Amplifier improves the measurement noise floor. The Output Conditioning circuits set the proper level to the FFT spectrum analyzer and limit the frequency range of the noise for the frequency segment being measured.

Figure 5 shows the more common measurement mode where two RF sources are phase-locked together in quadrature (that is, the phase difference of the sources is 90°). In this situation the **Phase Detector** outputs a signal proportional to the sum of the phase fluctuations on the two sources. The output from the Phase Detector is switched (by the **Input Switch**) into the same path as in the previous example. For this method to give valid results several conditions must be met.

- The L and R ports of the Phase Detector may be interchanged, and either source may be the local oscillator (the higher level "L" source). Neither source should exceed the specified maximum level.
- Either source can be the VCO (Voltage-Controlled Oscillator), but it must be tuneable with dc (dc FM) and compatible with the other source and the Interface.
- The VCO must be characterized (its tuning constant measured) before valid measurements can be made. This is done by the software after some general characteristics are input by the user.
- The two signals must remain in quadrature during the measurement. The Interface meter (not shown) is useful for visually monitoring phase quadrature drift between the two sources.
- The rms sum of the phase noise of both sources is measured inseparably.
- The conditioning circuits within the Interface must have been characterized before any measurements are made with the Interface. This is usually done annually; calibration data is stored in mass storage.

NOTE

When configuring the system for a phase-noise measurement, one source is arbitrarily defined as the "Device-under-Test" (DUT) and the other source as the "Reference". Either source can be the L source and either source can be the VCO.

Characterization of the phase-lock loop (PLL) is critical. If the loop is incorrectly set up, the loop may not acquire lock, may be unstable or even oscillate (create discrete FM), may track out the phase noise, or may generate erroneous results. Selection of the proper loop parameters is the task of the controller which, based on measured and user-input data, chooses the device parameters in the **Tune Voltage Conditioning** circuits which best match the VCO. The parameters that the controller can manipulate in the PLL are gain, offset, and frequency-response shaping (selection of poles and zeros).

A4 Phase Detector Assembly

Refer now to the main Block Diagram. The Phase Detector Assembly can conveniently be broken into three functional circuit blocks: (1) the phase demodulation circuits, (2) calibration signal routing circuits, and (3) tune-voltage conditioning circuits.

Phase Demodulation Circuits

If the phase noise on the device-under-test (DUT) has been demodulated externally, the demodulated phase noise is fed directly into the Interface via the front-panel NOISE INPUT connector. More commonly, the RF signal is demodulated by an internal RF or an optional microwave phase detector.

Service Model 11848A

The phase detectors are doubly balanced mixers. The standard RF Phase Detector covers the RF input range 5 to 1600 MHz; the Microwave Phase Detector (a chassis-mounted part) covers the range 1.2 to 18 GHz. With either detector, when the LO (L) and signal (R) inputs are in quadrature (that is, when the phase difference between the two signals is 90°), the detector's output is proportional to sum of the phase fluctuations of the two sources. The phase detector is selected by switch K13.

At this point the demodulated phase noise is fed into circuits that condition the signal to be measured by the spectrum analyzers or for voltage control of an external, voltage-tuneable source. Switch **K1** selects either the phase detector output or an external input. K1 also routes the signal from the NOISE INPUT to switch K12 when an internal phase detector has been selected.

NOTE

The circuits in the following discussions process "low-frequency" baseband signals (actually dc to 40 MHz) which are the demodulated phase noise from the RF and microwave input sources. To relate these low-frequency signals to the signal from the input sources, the following convention is used: the "noise signal" refers to the demodulated phase noise, "level" refers to the phase deviation of the phase noise, and "frequency" refers to the offset from the carrier (corresponding to the rate of the phase modulation).

Two filters in series, the 200 MHz Low-Pass Filter and the 60 MHz Low-Pass Filter, remove unwanted high-frequency components from the input noise signal itself or the internal phase detectors. Both filters are constant-resistance (or diplexer) types which match the 50Ω source impedance in both the passband and stopband. The 200 MHz Low-Pass Filter is a simpler, single-pole type; it comes first since it more efficiently terminates high-frequency mixing products. The 2 MHz Low-Pass Filter is switched in by K8 and K9 for carrier frequencies below 95 MHz. It too is a constant-resistance type.

The output of the 60 MHz Low-Pass Filter is sensed by the **Overload Detector**. Should the noise signal level at that point exceed 1V peak, the detector via the **Overload Flip-Flop** de-energizes switches K1, K12, K11, K14, and K10 (that is, they are set to the state shown in the block diagram), and the overloading noise signal is routed to the front-panel SPECTRUM ANALYZER connector. The overloading noise signal is thus prevented from overdriving the active circuits that follow. The Overload Flip-Flop also lights the front-panel OVERLOAD annunciator. The condition of the Overload Flip-Flop is read by the FFT spectrum analyzer (used as a dc voltmeter) via the 21.5 k Ω resistor and switch F6 in the A3 Analyzer Interface Assembly. This readback function is shared by the Out-of-Lock Flip-Flop.

The Low-Noise Amplifier (LNA) is switched in by K11 and K14 for maximum sensitivity whenever the noise signal level permits. The two switches are switched together. The gain of the amplifier is 40 dB open circuit.

For frequencies (that is, phase noise offsets) greater than 100 kHz, the measurement is made at the front-panel SPECTRUM ANALYZER connector where the RF spectrum analyzer is connected. The signal to this port comes from switch K9 through switches K11 and K14 (and the Low-Noise Amplifier when switched in) and switch K12. If an RF spectrum analyzer is not connected, the SPECTRUM ANALYZER connector must be terminated in 50Ω to preserve calibration.

For frequencies less than 100 kHz, the measurement is made at the front-panel TO HP 3561A INPUT connector, where the FFT spectrum analyzer is connected. When the Low-Noise Amplifier is switched in, the signal to this port comes from switch K9 through switch K11, the Low-Noise Amplifier, **S7**, and various switches, amplifiers, and filters in the A3 Analyzer Interface Assembly. When the Low-Noise Amplifier is bypassed, the path from switch K9 is through K11, K14, K12, S8, and the circuits in A3.

Switch **K12** routes the noise signal from K1 or K14 to the output paths to be discussed shortly. When the noise signal from K1 is selected, the output of the Low-Noise Amplifier (with its series 50Ω resistor) is terminated in 50Ω . Similarly, when the noise signal from K14 is selected, the signal from K1 is terminated in 50Ω .

Model 11848A Service

The output from K12 is routed as follows:

• To the front-panel SPECTRUM ANALYZER connector through a high-pass filter formed by an RLC network. The filter prevents overloading the RF spectrum analyzer by blocking low-frequency signals (<50 kHz). (Note that phase noise typically increases as the offset frequency decreases.)

- To switch **S8** for further processing on the A3 Analyzer Interface Assembly eventually to reach the front-panel TO HP 3561A INPUT connector.
- To the front-panel AUX MONITOR connector via **Buffer 1**. The dc path for the noise signal is through the 5 k Ω resistor. The ac path is through the buffer amplifier and the 0.01 μ F capacitor. The AUX MONITOR port is normally used to study (in the time domain) the quality of the noise signal being measured by the spectrum analyzer and to assist in obtaining a proper beat note during initial setup of the sources. The oscilloscope must have a high input impedance (>1 M Ω).
- To the 10 Hz/50 kHz High-Pass Filter on the A3 Analyzer Interface Assembly.

Calibration Signal Routing Circuits

During system hardware calibration (which is normally run annually to generate new calibration coefficients), the controller runs a series of tests to characterize the transfer function of many of the circuits in the Interface. The signal sources used during this calibration are the noise source in the FFT spectrum analyzer (when the frequency is less than 100 kHz) and the tracking generator in the RF spectrum analyzer (for frequencies to 40 MHz). The noise source in the FFT spectrum analyzer is also used when the Functional Tests are requested.

The noise source in the FFT spectrum analyzer is connected to the rear-panel NOISE INPUT FROM HP 3561A SOURCE OUTPUT connector. It is then routed through the A3 Analyzer Interface Assembly (through a 20 dB Pad) to switch K5. The tracking generator in the RF spectrum analyzer is connected to the rear-panel INPUT FROM HP 3585A TRACKING GENERATOR connector. It is then routed through switch K7 and a 35 dB pad (Pad 4) to K5.

Switch K5 routes the calibration input sources to K2 via a series of 3 dB pads and switches (Pad 1, Pad 2, Pad 3, and switches K4 and K3). Having two switches and three pads improves the isolation in the open state. K4 and K3 switch together.

Tune-Voltage Conditioning Circuits

Refer now to switch K10, which is at the output of switch K9. When phase noise is measured using a phase-lock loop, the noise signal from K10 is the signal which, after further processing, tunes the external voltage-controlled oscillator (VCO) to phase lock it to a second source. The signal path splits at the output of Buffer 2 to drive two tuning ports: the front-panel and rear-panel TUNE VOLTAGE OUTPUT connectors. The path to the rear panel is for user convenience, and is inverted to that of the front-panel.

A fixed 12 dB Amplifier, a programmable amplifier (Gain 1), a fixed 6 dB pad (Pad 4), and a second programmable amplifier (Gain 2) set the path gain up to the Integrator. The Integrator has very high gain at low-frequencies to hold the phase detector error near zero in the presence of source drift.

Noise signals in excess of 2.5V (positive or negative) at the input and output of the Integrator are sensed by the **Comparator** which trips the **Out-of-Lock Flip-Flop**. This condition occurs when the two input sources go out of lock or when the tune voltage exceeds 25% of its entered tuning range or when a phase transient exceeds 0.25 rad even though the sources are still locked. The flip-flop shorts the feedback path of the Integrator (forcing it to unity gain) and lights the front-panel OUT OF LOCK annunciator. The condition of the Out-of-Lock Flip-Flop is read by the FFT spectrum analyzer (used as a dc voltmeter) via the $46.4 \text{ k}\Omega$ resistor and switch F6 in the A3 Analyzer Interface Assembly. This readback function is shared by the Overload Flip-Flop.

Service Model 11848A

The output of the Integrator, where the panel **Meter** is placed, is the most sensitive point to monitor phase quadrature error. When a measurement is made using a phase-lock loop, the meter indicates whether or not the control voltage being sent to an external VCO is in an acceptable range. In particular, it warns the user when one of the input sources is drifting (before the loop unlocks). Note, however, that the meter will also read near zero when phase lock is broken because the average dc voltage in a beatnote between two sources is near zero and the Out-of-Lock Flip-Flop forces the Integrator to unity gain.

Switch **S3** (with switch K10) closes the phase-lock loop. S3 is opened when a noise measurement is made without using a phase-lock loop to uncouple the output circuits but leave the Meter in. **Attenuator 2** can be set to either 0 or 6 dB; it controls the signal level into the Summing Junction.

The **Summing Junction** has several functions:

- It sums the phase-error signal with a programmable dc output from DAC 1 which tunes the external VCO.
- It routes the noise source from the FFT spectrum analyzer (via switch **S1**) to the output circuits when the error transfer function of the closed phase-lock loop is measured. From this measurement, correction factors are calculated in the phase-noise measurement. (**S2** is unused.)
- It enables the **Search Oscillator** when switch **S4** is closed and the phase-lock loop is unlocked. The oscillator starts automatically when the loop goes out of lock and provides a 1.6 Hz search signal which sweeps the external VCO until the VCO is captured by the loop. When the Search Oscillator is oscillating, the **Oscillation Detector** sets the Out-of-Lock Flip-Flop.

Before the tune voltage is applied to the VCO (connected to the rear-panel TUNE VOLTAGE OUTPUT connector), it passes through programmable Lag-Lead Network 1, Buffer 2, programmable Attenuator 1, Buffer 3, and Lag-Lead Network 2. The latter three circuits are duplicated in the A3 Analyzer Interface Assembly which output the tune voltage to the front-panel TUNE VOLTAGE OUTPUT connector. (The front-panel output is preferred because of a floating amplifier which breaks potential ground loops.)

The lag-lead networks shape the tune voltage to give the phase-lock loop maximum low-frequency gain (for good drift tracking) while maintaining loop stability. The frequency responses of the lag-lead networks are shown in the block diagram notes. Lag-Lead Network 1 is programmable; the controller selects the optimum pole and zero frequencies based on the measured tuning characteristics of the VCO.

A3 Analyzer Interface Assembly

The primary function of the A3 Analyzer Interface Assembly is to condition the output noise signal to be measured by the FFT spectrum analyzer. The noise signal is routed from the A4 Phase Detector Assembly through switches S7 and S8 in that assembly. The noise signal passes through a series of amplifiers and filters.

Gain stage **Gain 3** has two parts: (1) a programmable-gain amplifier (6, 12, 20, and 26 dB) with an output at switch **L4** and (2) an additional 6 dB attenuator with its output through switch **L3**. (The gains stated for Gain 3 are for the entire path from the input of the amplifier to the output of the High-Pass Filters. The High-Pass Filters have a passband gain of 6 dB.) The controller sets the gain so as to present an optimum level for the input to the FFT spectrum analyzer.

After passing through **Buffer 1**, the signal is low-pass filtered. Since the measurement range of the FFT spectrum analyzer is 100 kHz, the signal is filtered by the **100 kHz Low-Pass Filter** then passed through one of a set of decade-spaced **Low-Pass Filters** as selected by switches **F0** through **F5**. The filters match the default sweep ranges of the FFT spectrum analyzer and remove the high-frequency, out-of-range components. (The filters match the default sweep ranges even when sweep segments other than default are selected.)

Model 11848A Service

After passing through **Buffer 2**, the signal is high-pass filtered. The decade-spaced **High-Pass Filters**, selected by **H1** through **H5**, are set to block low-frequency components from dc to one-tenth the sweep range of the FFT spectrum analyzer. This is necessary because the noise signal frequently has very large, low-frequency components due to the nature of phase noise. (As with the Low-Pass Filters, these filters match the default sweep ranges when other sweep segments are selected.) The **AC/DC Adaptive Coupler**, when set to dc, restores the dc component of the noise signal when the need arises to measure it with the FFT spectrum analyzer. In the ac mode, the AC/DC Adaptive Coupler is a 16 MHz high-pass filter.

The noise signal is finally sent to the front-panel TO HP 3561A INPUT connector via **Floating** Amplifier 2 which has a gain of -1. Having a floating output improves rejection of line-related signals resulting from ground loops.

The remaining circuits in the A3 Analyzer Interface Assembly do not directly relate to the measurement of the noise signal by the FFT spectrum analyzer.

The Calibration Oscillator outputs a 100 kHz squarewave. It is switched on when a new measurement is selected to compare the amplitude calibration of the RF spectrum analyzer relative to the FFT spectrum analyzer. (The frequency ranges of the two spectrum analyzers overlap at 100 kHz.)

The 10 Hz/50 kHz High-Pass Filter, Peak Detector, and Peak Hold circuits have three functions: (1) to sense the presence of a beatnote when measuring phase noise using a phase lock loop, (2) to determine whether to insert the Low-Noise Amplifier in the A4 Phase Detector Assembly, and (3) to provide signal level information for ranging the RF spectrum analyzer. The first two functions use the 10 Hz high-pass filter; the third function uses the 50 kHz filter (which matches filtering to the RF analyzer input provided by the $0.068~\mu F$ capacitor at J2 on A4.)

DAC 2, DAC 3, and the DAC SUMMING JUNCTION output a programmable dc voltage to tune three VCOs: (1) the 400 MHz VCO on A8, (2) the 10 MHz VCXO on A7, and (3) the 10 MHz VCXO on A6. DAC 3 has 1 mV resolution; DAC 2 has 50 mV resolution. Switch L11 enables the same three VCOs to be tuned as the VCO in a measurement of phase noise using a phase-lock loop. Note that the VCOs are all tuned simultaneously. (See the discussions below about the function of these VCOs.)

Attenuator 3, Floating Amplifier 1, and the Lag-Lead Network duplicate the function of Attenuator 1, Buffer 3, and Lag-Lead Network 2 on the A4 Phase Detector Assembly. The path is enabled by switch L10. Floating Amplifier 1 breaks up ground loops on the VCO tune voltage and makes the front-panel TUNE VOLTAGE OUTPUT the preferred output. (See the discussion on Lag-Lead Network 2 on A4 for the function of the Lag-Lead Network.)

Switch L8 routes the rear-panel TONE INPUT or the NOISE INPUT FROM HP 3561A SOURCE OUTPUT to the Phase Modulator in the A7 10 MHz Modulated VCXO B Assembly.

A6 10 MHz VCXO A Assembly

The 10 MHz ±100 Hz VCXO (voltage controlled crystal oscillator) provides a very clean, tuneable source available at the front-panel 10 MHz A connector or the rear-panel 10 MHz SOURCE A OUTPUT OR AMP INPUT connector. This source can be used as a tuneable VCO for measurement of 10 MHz sources or in conjunction with the 10 MHz ±1 kHz VCXO in A7 for demonstration purposes. The **Power Amplifier** boosts the signal level high enough that it can serve as the signal to the L port of the input phase detectors.

The switch at the output of the oscillator allows the amplifier to be used by itself in other applications such as boosting the power level of the 10 MHz \pm 1 kHz VCXO in A7.

Service Model 11848A

A7 10 MHz Modulated VCXO B Assembly

The 10 MHz ± 1 kHz VCXO (voltage controlled crystal oscillator) provides a clean, tuneable source available at the front-panel 10 MHz B connector. This source can be used as a tuneable VCO for measurement of 10 MHz sources or in conjunction with the 10 MHz ± 100 Hz VCXO in A6 for demonstration purposes. It can also be phase modulated by the **Phase Modulator** for testing phase noise accuracy in the system performance tests.

A8 400 MHz VCO Assembly

The **400 MHz VCO** provides a clean, wide-range, tuneable source available at the front-panel 350-500 MHz connector. This source can be used as a tuneable VCO for measurement of 350-500 MHz sources or in conjunction with the 400 MHz Oscillator in A9 to test flatness in phase-noise measurement or by itself for noise-floor testing using a power splitter and delay line.

Pad 1, Amplifier 1, Pad 2, Amplifier 2, and Amplifier 3 provide the correct level to the front-panel connector for driving the input phase detector. The 550 MHz Low-Pass Filter removes harmonics of the signal.

A9 400 MHz Oscillator Assembly

The **400 MHz Oscillator** provides a fixed source available at the front-panel 400 MHz connector. The **50 dB Pad** lowers the signal level to reduce the signal-to-noise ratio. The **Amplifiers** boost the signal level back up but also add noise of their own. This source is primarily used in conjunction with the 350-500 MHz VCO in A8 to check the flatness of the broadband noise beyond 500 kHz or for demonstration purposes.

A1 HP-IB Input/Output Assembly

The A1 HP-IB Input/Output Assembly (not shown in the block diagram) contains the digital circuitry to interface the controllable hardware with the controller via HP-IB. It also contains the power supplies. The power supplies are +5V, +15V, and -15V.

Model 11848A Service

Troubleshooting

General

Troubleshooting the HP 11848A Phase Noise Interface usually begins with troubleshooting a problem in the HP 3048A Phase Noise Measurement System. Several programs in the System-supplied main software can assist in isolating the fault to a System device. Details on these programs are found in the HP 3048A Reference Manual for the System or in the main software under the Help function. Some general guidelines are discussed below. It is usually more efficient to use these programs until they point to the Interface as the faulty System device; the Diagnostic program is then loaded to troubleshoot the Interface itself.

Troubleshooting Helps in the Main System Software

Some of the features in the main software which are useful in isolating the faulty System device are found in the following list. To call these programs, go to the main menu and press the softkey labeled Spcl. Function. A menu of Advanced-User Functions will appear from which the programs can be selected or other menus called.

Calibrate System. A series of transfer function measurements are made on various signal paths in the Interface. The measurement data is stored as calibration factors which the controller uses (either directly or in more involved calculations) to correct the measured phase noise data whenever that signal path is used. Normally the Calibrate System program is invoked only for the annual System calibration or when the Interface has been repaired. Any difficulties encountered when the calibration program is being run may point to the Interface. For example, a catastrophic failure of a high-pass filter in the Interface will generate data that is too far out of limits to be accepted as a legitimate transfer function; the program will then abort the measurement.

Performance Tests. To verify that the system meets its published specifications, a series of Performance Tests can be run. The failure of a test may contain enough clues to point to a failure in the Interface.

Internal Adjustments. Often small out-of-specification results of the Performance Tests or Functional Checks can be corrected by means of adjustments, particularly if the condition is due to a dc offset voltage that is out of limits.

Functional Checks. These tests are an extension of the Performance Tests that test the general operational integrity of the Interface itself. The test limits are generally loose. (The tests in the Diagnostic program are similar to the Functional Checks, but they attempt to diagnose the failure in addition to simply indicating out-of-limits data.)

HP 11848A Control. Arbitrary and complete control of the programmable functions of the Interface from the controller keyboard is provided by the HP 11848A Control program. A single display contains all the Interface state information. Because of the compactness of the state information, you should consult the HP 3048A Reference Manual when running the program. (The keyboard control feature of the Diagnostic program is similar to this program.)

Troubleshoot Mode. When the Troubleshoot Mode (a subset of Test Mode) is enabled, information beyond simple error messages can be invoked. For example, tests can be aborted to the HP 11848A Control mode which shows the Interface state when the abort occurred.

Service Model 11848A

Running the Diagnostic Program

The Diagnostic program is independent of the main System software. To run the Diagnostic program:

- 1. Gather and connect the equipment. You will need, in addition to the faulty Interface, the following equipment:
 - HP 3561A Dynamic Signal Analyzer (preferably the one in the System),
 - HP Series 200 or 300 Computer with disc drive and HP-IB, and
 - optionally, a printer compatible with the System Controller.
- 2. Reset the computer. If the computer is not running BASIC, boot up BASIC 4.0. (BASIC 4.0 is the supplied operating system. BASIC 2.1 and 3.0 will also work.)
- 3. Key in LOAD "Diagnostic" and press RUN.
- 4. If a display appears which indicates that the HP 3561A, HP 11848A, or printer HP-IB addresses are not correct, you can (1) physically change the address of the device to match the displayed address or (2) change the displayed address of the device using the cursor control keys (the knob, arrow keys, tab keys, backspace key, or space bar); then press ENTER. If the display still indicates an incorrect address, then the device does not respond when it is addressed. (It may be broken or turned off.) If a printer is not available, it can be deleted at this time.
- 5. The display will now show the Task Selection menu screen. This is the main screen for the Diagnostic program. The program is now ready for troubleshooting the Interface.

Features of the Diagnostic Program

Most explanations you will need to use the program are part of the program itself either as prompts on the bottom line of the display or as entire displays of information.

Softkeys are not used in the program. Instead, highlighted (inverse video) characters are displayed; pressing a key matching the highlighted character initiates the selected action. Very often the letter "I" in the word "Information" will be highlighted. Pressing "I" immediately brings on to the display information pertinent to the current display. Use it often. It is the Operating Manual for the Diagnostic program.

The Diagnostic program is referenced to the Block Diagram found herein. Refer to it frequently. The program has two basic modes of operation.

- It runs tests, displays results, and in many cases will attempt to pinpoint the failure.
- It gives you arbitrary control over any programmable circuit device in the Interface.

When you use the Diagnostic program to troubleshoot the Interface, the normal procedure is:

- 1. Run tests which you think might locate the fault. (When running the test for the first time, respond with "No" when prompted "Stop on failure?".)
- 2. When a failure is noted in a test, rerun the test and request stopping when a failure is detected. When stopped, request to view the Interface setup.
- 3. The display will now show the current state of the Interface and enables you to alter the state to check the functioning of a suspected circuit. Often a faulty control line will cause a circuit to malfunction. To check for this,
 - Press the key corresponding to the desired type of the circuit. (For example, press "A", for "Attenuator", if one of the programmable amplifiers is to be checked.)
 - Now press "I" to display the information for the circuit type (for example, programmable attenuators). The information will show the logic control states of all the circuits of that type. (At this point, if a printer is attached, you may wish to print the information display.)
 - Now return to the previous screen (press "X", for exit) and follow the logic levels through the control circuits to the (A1) control assembly.
- 4. Once the faulty circuit or control line has been isolated, you can continue isolation to the faulty component or replace the faulty assembly. (Some assemblies are on an exchange program.)

General Information

INTRODUCTION

This Service Manual contains information for installation of the Hewlett-Packard Model 11848A Phase Noise Interface.

The HP 11848A is the Phase Noise Interface for the HP 3048A Option 301 Phase Noise Measurement System. The Interface supports several measurement techniques for phase noise and AM noise measurements. Inside the Interface are the phase detectors, amplifiers, filters, and switches necessary to measure phase noise over a frequency range of 5 MHz to 18 GHz. An input for an external phase detector outside that frequency range is also provided. The built-in sources allow the system to functionally check all of its signal handling circuits to insure proper operation before measurements are made.

INSTRUMENTS COVERED BY THIS MANUAL

Attached to the instrument is a serial number plate. The serial number is in the form 1234A00123. The first four digits and the letter are the serial prefix. The last five digits form the sequential suffix that is unique to each instrument.

SPECIFICATIONS

The specifications for the Interface are included in the specifications for the HP 3048A Option 301 Phase Noise Measurement System which specifies the entire system. There are no specifications that apply to the Interface alone.

PERFORMANCE TESTS

The performance Tests for the Interface are included in the performance tests for the HP 3048A Option 301 Phase Noise Measurement System. These tests can be found in the HP 3048A Option 301 System Calibration Manual.

It is not necessary to run the System performance tests after the System is initially installed. These tests are performed at the factory before shipment. However, performance tests should be run every 12 months or whenever the Interface has been repaired.

CALIBRATION

The calibration of the Interface consists of generating correction factors for the various measurement paths and storing them on the software disc for corrections of 0 Hz to 100 kHz as LOWDATA.CAL and 100 kHz to 40 MHz as HIGHDATA.CAL. Also stored in these files are the nominal voltages to set each internal source to its nominal frequency.

The calibration of the Interface is only part of the calibration of the HP 3048A Option 301 Phase Noise Measurement System and must be done with the System. For calibration refer to the HP 3048A Option 301 Phase Noise Measurement System Calibration Manual.

The complete calibration for a HP 3048A Phase Noise Measurement System includes the following:

- 1. HP 3561A Dynamic Signal Analyzer bench calibration.
- 2. RF Analyzer bench calibration. (If an RF analyzer is configured in the system.)
- 3. HP 3048A Functional Checks.
- 4. HP 11848A Adjustments. (The adjustments should only be run if the Functional Checks show a problem.)
- 5. HP 3048A System Calibration Option 2. (This is total calibration of the HP 11848A Interface's measurement paths.)
- 6. HP 3048A Performance Tests.

Before calibrating the System, the HP 3561A Dynamic Signal Analyzer and any configured RF analyzer should be separately bench calibrated if they are beyond their calibration period.

NOTE

The measurement of phase noise, as implemented in the HP 3048A, is a ratio measurement where both the numerator (the noise power) and the denominator (the carrier's power) of the ratio are measured by the same system spectrum analyzer(s). The accuracy of this measured ratio depends on the amplitude linearity of the spectrum analyzer. The amplitude linearity calibration of the spectrum analyzer will be traceable to the National Institute of Standards (NIST) if the instrumentation used to perform the calibration is traceable to NIST.

The following are guidelines as to when the Interface hardware calibration and System performance tests should be run:

- It is not necessary to calibrate the Interface after the System is initially installed. The calibration procedure is done at the factory before shipment, and the unique calibration data for the Interface is stored on the software disc.
- Whenever the environment changes 10°C or more, Option 1 calibration should be run to generate new calibration data for the Interface to ensure accurate System performance.
- Once a year, after a repair of the Interface, or when a problem is suspected in the Interface the following test should be run to ensure accurate System measurement results:
 - a. Functional Checks.
 - b. Adjustments. (The adjustments should only be run if the Functional Checks show a problem.)
 - c. Calibration Option 2. (This is a total calibration of the Interface measurement paths.)
 - d. Performance Tests.

The performance tests can be run more often if desired to ensure that the system meets the published specifications contained in Section 1 of the HP 3048A Option 301 Operating Manual.

It is suggested that the performance test be run in the following order:

- 1. Spur Accuracy Test (spurious signal).
- 2. Noise Flatness Test. (This test need only be run if an RF analyzer is included in the system configuration.)
- 3. Internal Noise Floor.

DOCUMENTATION UPDATING

An instrument manufactured after the printing of these manuals may have a serial-number prefix that is not listed on the manual title page. Having a serial-number prefix that is greater than that shown on the title page indicates that the instrument is slightly different from those documented in the manual. In this case, your manual may be provided with updating information to make it as current as possible. This updating information contains all major change information that applies to instruments beyond the serial-prefix range defined on the title page. Minor changes may not be included but will be covered in subsequent updates you can receive by joining the Documentation Update Service.

A Description of the Manual Update Packet

A Manual Update packet consists of replacement and addition pages which should be incorporated in your manual to bring it up to date. (An addition page results when new information won't fit on a replacement page.)

Signing Up for the Documentation Update Service

Hewlett-Packard offers a Documentation Update Service that will provide you with further updates and changes as they become available. If you have not received update information that matches the serial number of your instrument, you can receive this information through the Update Service.

If you operate or service instruments with different serial prefixes, we strongly recommend that you join this service immediately to ensure that your manual is kept current.

For more information, refer to the Documentation Update Service reply card included in this manual or contact:

Hewlett-Packard Company Product Support Department 24001 E. Mission—TAF C-34 Spokane, WA 99220 (509) 921-4001

Also, if you join the update service, you can indicate whether you choose to be contacted in the future about the quality of the documentation you receive. We are constantly trying to provide the best documentation possible and periodically survey our customers as to their expectations and the usability of the manuals we provide.

SAFETY CONSIDERATIONS

The Interface is a Safety Class I instrument (that is, provided with a protective earth terminal). Before operation, look over the Phase Noise Interface and its related documentation to get familiar with safety markings and instructions. Refer to the *Safety Considerations* page found at the beginning of this manual for a summary of the safety information. Safety information that applies to the specific task at hand (for example, installation) is found in this manual.

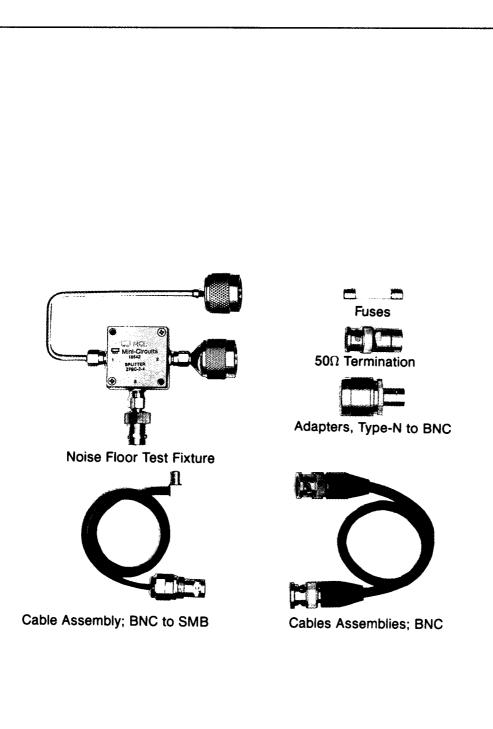

Figure 1. Accessories Supplied

ACCESSORIES SUPPLIED

The accessories supplied are pieces of equipment that are shipped with every Interface. The accessories are shown in Figure 1.

Line Power Cable. The line power cable may be supplied in several plug configurations, depending on the destination of the original shipment. Refer to *Power Cables* in the *Installation* section of this *Service* manual.

Fuses. Fuses with a 0.75A rating for 115 Vac (HP part number 2110-0063) and a 0.5A rating for 230 Vac (HP part number 2110-0012) are supplied. One fuse is factory installed according to the voltage available in the country of original destination. Refer to *Power Requirements* in the *Installation* of this *Service* manual.

HP 3048A Option 301 Software and Manual Set. The HP 3048A software and associated manuals are shipped with the Interface.

HP 3048A Software (HP part number 11838-10002).

HP 11848A Service Manual (HP part number 11848-90004).

HP 3048A Option 301 Installation Guide (HP part number 03048-90043).

HP 3048A Option 301 Operating Manual (HP part number 03048-90042).

HP 3048A Option 301 System Calibration Manual (HP part number 03048-90041).

HP 3048A Option 301 Reference Manual (HP part number 03048-90040).

50 Ω **Termination.** This 50 Ω load is used to terminate the Interface's Spectrum Analyzer output if no RF spectrum analyzer is available (HP part number 1250-0207).

Adapters, Type-N to BNC. Three adapters are provided for system operation (HP part number 1250-0780).

Cable Assemblies: BNC. Two 30 cm (12 in.) cables are provided for system operation (HP part number 8120-1838).

Noise Floor Test Fixture. This test fixture is used to run performance tests (HP part number 11848-61032).

Cable Assembly: BNC to SMB. This cable assembly can be used during troubleshooting (HP part number 08954-60105).

RECOMMENDED TEST EQUIPMENT

Table 1 lists the test equipment and accessories recommended for use in testing, adjusting, and servicing the Interface. If any of the recommended equipment is unavailable, instruments with equivalent minimum specifications may be substituted.

Tests for the Interface are performed during the HP 3048A Performance Tests which are available in the HP 3048A Option 301 System Calibration Manual in Performance Tests.

Instrument Type	Model Number	Use*
Dynamic Signal Analyzer Counter (550 MHz) Function Generator	HP 3561A HP 5383A, HP 5386A HP 3312A, HP 3325A	A,C,P,T ** P P,T
Oscilloscope Power Meter and Sensor	HP 1740A HP 435B or HP 436A with	T T
	HP 8481A or HP 8482A	

Table 1. Recommended Test Equipment

OPTIONS AVAILABLE

Options are variations on the standard instrument which can be ordered during the purchase.

Electrical Options

Option 201: Add High Frequency Phase Detector. This option adds a 1.2 to 18 GHz phase detector to the Interface. This phase detector extends the range of carrier frequencies that can be demodulated within the Interface without external down conversion by the System. All of the HP 3048A specifications from 1.6 to 18 GHz carrier frequency are valid with this option.

Mechanical Options

Option 907: Front-Handle Kit. Front handles are provided when Option 907 is ordered. After shipment, you can order a Front-Handle Kit as HP part number 5061-9689.

Option 908: Rack-Flange Kit. Rack flanges are provided for the HP 11848A Phase Noise Interface when Option 908 is ordered. After shipment, you can order a Rack-Flange Kit as HP part number 5061-9677.

Option 909: Rack-Flange and Front-Handle Combination Kit. This is not a Front-Handle Kit and a Rack-Flange Kit packaged together; it is a unique part that combines both functions. Combination kits are provided for the HP 11848A Phase Noise Interface when Option 909 is ordered. After shipment, you can order a Rack-Flange and Front-Handle Combination Kit as HP part number 5061-9683.

^{*} A = Adjustments, C = Functional Checks, P = Performance Tests, T = Troubleshooting

^{**} The HP 3561A is included with the HP 3048A system.

INSTALLATION

INTRODUCTION

This section provides the information needed to install the HP 11848A Phase Noise Interface. Included is information pertinent to initial inspection, power requirements, line voltage selection, power cables, environment, storage, and shipment.

INITIAL INSPECTION

WARNING

To avoid hazardous electrical shock, do not perform electrical tests when there are signs of shipping damage to any portion of the outer enclosure (covers and panels).

Inspect the shipping container for damage. If the shipping container or cushioning material is damaged, it should be kept until the contents of the shipment have been checked for completeness and the instrument has been checked mechanically and electrically. Procedures for checking electrical performance are given in the Confidence Check found in the HP 3048A Option 301 Operating Manual. If the contents are incomplete, if there is mechanical damage or defect, or if the instrument does not pass the electrical performance test, notify the nearest Hewlett-Packard office. If the shipping container is damaged, or the cushioning material shows signs of stress, notify the carrier as well as the Hewlett-Packard office. Keep the shipping materials for the carrier's inspection.

PREPARATION FOR USE

Power Requirements

The HP 11848A requires a power source of 100 Vac (90 to 105 Vac), 120 Vac (108 to 126 Vac), 220 Vac (198 to 231 Vac), or 240 Vac (216 to 252 Vac), 47.5 to 440 Hz single phase. Power consumption is 260 VA maximum.

WARNING

This is a Safety Class I product (i.e., provided with a protective earth terminal). An uninterrupted safety earth ground must be provided from the Mains power source to the product input wiring terminals, power cord, or supplied power cord set. Whenever it is likely that the protection has been impaired, the instrument must be made inoperative and be secured against any unintended operation.

If this instrument is to be energized via an external autotransformer for voltage reduction, make sure that the common terminal is connected to the earth pole of the power source.

CAUTION

BEFORE PLUGGING THIS INSTRUMENT into the Mains (line) voltage, be sure the correct voltage and fuse have been selected.

A rear-panel, line power module permits operation from 100, 120, 220, or 240 Vac. The number visible in the window (located on the module) indicates the nominal line voltage to which the instrument must be connected. Verify that the line voltage selection and the fuse are matched to the power source. Refer to Figure 2, Line Voltage and Fuse Selection.

Two fuses are supplied with each instrument. One fuse has the proper rating for 110/120 Vac line operation (HP part number 2110-0063; 0.75A, 250V, non-time-delay). The other fuse is rated for 200/220 Vac operation (HP part number 2110-0012; 0.5A, 250V, non-time-delay).

One fuse is installed in the instrument at the time of shipment. The rating of the installed fuse is selected according to the line voltage specified by the customer. If the voltage is not specified, the rating of the installed fuse will be selected according to the country of destination.

WARNING

For protection against fire hazard, the line fuse should only be a 250V normal blow fuse with the correct current rating.

Power Cables

WARNING

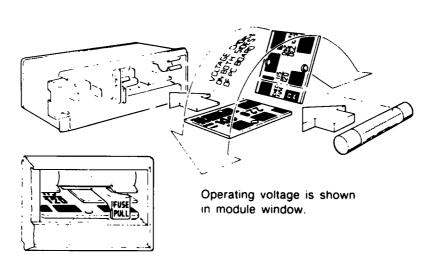

BEFORE CONNECTING THIS INSTRUMENT, the protective earth terminal of the instrument must be connected to the protective conductor of the (mains) power cord. The mains plug shall only be inserted in a socket outlet provided with a protective earth contact. The protective action must not be negated by the use of an extension cord (power cable) without a protective conductor (grounding). Grounding one conductor of a two conductor outlet is not sufficient protection.

This instrument is equipped with a three-wire power cable. When connected to an appropriate ac power receptacle, this cable grounds the instrument cabinet. The type of power cable plug shipped with each instrument depends on the country of destination. Refer to Table 2 on for the part numbers of the power cables and Mains plugs available.

Mating Connectors

Coaxial Connectors. Coaxial mating connectors used with the Phase Noise Interface should be either the 50-ohm BNC male connectors or 50-ohm Type-N male connectors that are compatible with those specified in US MIL-C-39012.

The application note, "Principles of Microwave Connector Care" (HP part number 5958-7442) can help you improve measurements and reliability. Suggestions in the application note will help you get the best performance from all microwave connectors. It will show what to look for when cleaning and inspecting connectors (in order to preserve their precision and extend their life) and how to make the best possible microwave connections (improving the accuracy and repeatability of all your measurements).

Selection of Operating Voltage and Fuse Replacement

- 1. Open cover door, pull the FUSE PULL lever and rotate to left. Remove the fuse.
- 2. Remove the Line Voltage Selection Card. Position the card so the line voltage appears at top-left corner. Push the card firmly into the slot.
- Rotate the FUSE PULL lever to its normal position. Insert a fuse of the correct value in the holder. Close the cover door.

Figure 2. Line Voltage and Fuse Selection

Operating Environment

The operating environment should be within the following limitations:

Temperature	0°C to +55°C
Humidity	
Altitude	
Airflow	5.8 mm (0.23 in.) minimum clearance underneath the
	instrument and sufficient clearance behind the
	instrument for air flow that is not obstructed.

Rack Mounting

Rack mounting information is provided with the rack mounting kit. If the kit was not ordered with the instrument as an option, it may be ordered through the nearest Hewlett-Packard office. For rack-mount kit part numbers, refer to *Mechanical Options* in the *General Information* section of this manual.

^{*} Part number shown for plug is industry identifier for plug only. Number shown for cable is HP Part Number for complete cable including plug. E = Earth Ground; L = Line; N = Neutral; STR = Straight

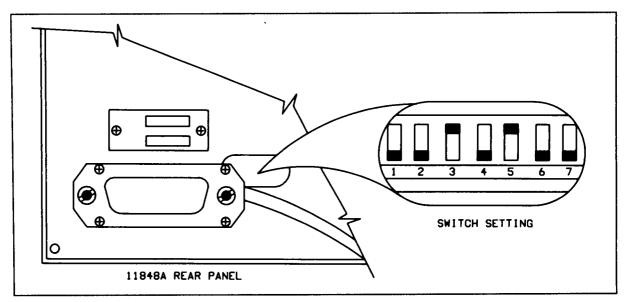

Figure 3. HP-IB Address Switch

HP-IB Address Selection

The HP-IB address is selectable using rocker switches on the rear-panel of the Phase Noise Interface. These rocker switches are set up in a binary format with switch number 1 as the least significant digit and switch number 5 as the most significant digit. (Switches 6 and 7 are not used.) Any one of 31 HP-IB addresses can be set (00 through 30).

The address of the HP 11848A is set to 20 at the factory (switches 3 and 5 high; 16 + 4 = 20). Refer to Figure 3.

STORAGE AND SHIPMENT

Environment

The instrument should be stored in a clean, dry environment. The following environmental limitations apply to both storage and shipment:

Temperature	55°C to +75°C
	5% to 95% (maximum wet-bulb temperature = 40° C)
Altitude	

Packaging

Original Packaging. Containers and materials identical to those used in factory packaging are available through Hewlett-Packard offices. If the instrument is being returned to Hewlett-Packard for servicing, attach a tag indicating the type of service required, return address, model number, and full serial number. Also mark the container FRAGILE to assure careful handling. In any correspondence refer to the instrument by model number and full serial number.

Other Packaging. The following general instructions should be used for repackaging with commercially available materials:

- 1. Wrap the instrument in heavy paper or plastic. (If shipping to a Hewlett-Packard office or service center, attach a tag indicating the service required, return address, model number, and full serial number.)
- 2. Use a strong shipping container. A double wall carton made of 2.4 MPa (350 psi) test material is adequate.
- 3. Use enough shock-absorbing material (75 to 100 mm layer; 3 to 4 in.) around all sides of the instrument to provide firm cushion and prevent movement in the container. Protect the front panel with cardboard.
- 4. Seal the shipping container securely.
- 5. Mark the shipping container FRAGILE to ensure careful handling.

Troubleshooting

General

Troubleshooting the HP 11848A Phase Noise Interface usually begins with troubleshooting a problem in the HP 3048A Option 301 Phase Noise Measurement System. Some general guidelines are discussed below.

Troubleshooting Helps in the Main System Software

The HP 3048A Option 301 Software has two programs to calibrate and test the system. For information on using these programs, refer to the HP 3048A Option 301 System Calibration Manual.

Calibrate System. A series of transfer function measurements are made on various signal paths in the Interface. The measurement data is stored as calibration factors which the controller uses (either directly or in more involved calculations) to correct the measured phase noise data whenever that signal path is used. Normally the Calibrate System program is invoked only for the annual System calibration or when the Interface has been repaired. Any difficulties encountered when the calibration program is being run may point to the Interface. For example, a catastrophic failure of a high-pass filter in the Interface will generate data that is too far out of limits to be accepted as a legitimate transfer function; the program will then abort the measurement.

Performance Tests. To verify that the system meets its published specifications, a series of Performance Tests can be run. The failure of a test may contain enough clues to point to a failure in the Interface.

Internal Adjustments. Often small out-of-specification results of the Performance Tests or Functional Checks can be corrected by means of adjustments, particularly if the condition is due to a dc offset voltage that is out of limits.

Functional Checks. These tests are an extension of the Performance Tests that test the general operational integrity of the Interface itself. The test limits are generally loose.

HP 11848A Control. Arbitrary and complete control of the programmable functions of the Interface from the controller keyboard is provided by the HP 11848A Control program. A single display contains all the Interface state information. Because of the compactness of the state information, you should consult the HP 3048A Option 301 Reference Manual when running the program.

Troubleshoot Mode. When the Troubleshoot Mode (selected from the Advanced Functions Menu) is enabled, information beyond simple error messages can be invoked. For example, tests can be aborted to the HP 11848A Control mode which shows the Interface state when the abort occurred.

Replaceable Parts

INTRODUCTION TO THIS SECTION

This section contains information for ordering parts. Table 3 lists reference designations, and Table 4 lists abbreviations that are used in the Replaceable Parts List. Table 5 lists all replaceable parts in the instrument. Table 6 contains the names and addresses that correspond to the manufacturer's code numbers listed in Table 5. Also included in this section are photographs and drawings to aid in identifying and ordering chassis mounted parts and mechanical parts.

REFERENCE DESIGNATIONS AND ABBREVIATIONS USED IN THIS MANUAL

Table 3 lists the reference designation letters for electrical parts in the instrument. The letter designations found in Table 3 are coupled with numeric designations to provide a unique reference designation for each part in the instrument. For example A6R1 is the reference designation of a particular resistor R1 on assembly A6.

Table 4 lists abbreviations used in the parts list and on schematics.

REPLACEABLE PARTS LIST

Table 5 is a list of replaceable parts and is organized as follows:

- a. Electrical assemblies and their components with reference designations in alphanumeric order.
- b. Chassis-Mounted parts with reference designations in alphanumeric order.
- c. Mechanical parts with reference designations in alphanumeric order.

Ordering Parts.

Instrument Serial Numbers.

Attached to the rear of the instrument is a serial-number plate. The first four digits and the letter are the instrument serial-number prefix. The last five digits (serial-number suffix) are unique to each instrument. When parts in the instrument are changed, the serial-number prefix of the instrument may also change. This means that sometimes a part will be listed more than once in the the replaceable parts list along with a serial-number prefix or range of serial-number prefixes. Find the serial-number prefix on the serial plate of your instrument and order the part listed under the corresponding prefix in the table. If no serial prefix information is listed, the part is compatible in instruments of all serial numbers.

NOTE

It is possible that some assemblies in your instrument have been updated (through service or retrofitting) to reflect changes made to instruments with serial-number prefixes later than that shown on your instrument serial-number tag. Be sure to note the board number of the assembly being repaired or replaced when ordering parts for your instrument.

How to Order

To order a part in the Replaceable Parts List, call or write the nearest Hewlett-Packard Sales Office. Have the following information ready to speed the ordering process:

- 1. The Hewlett-Packard part number with the check digit. (The check digit will ensure accurate and timely processing of your order.)
- 2. The quantity required.
- 3. An approved purchase order number. (Sometimes required.)

NOTE

Within the USA, it is better to order directly from the HP Parts Center in Mountain View California. Ask your nearest HP office for information and forms for the "Direct Order System".

Replaceable Parts List Updating (Manual Updates)

A "MANUAL UPDATES" packet is shipped with the manual, when necessary, to provide the most current information available at the time of shipment. These packets consist of replacement and addition pages which should be incorporated into the manual to bring it up to date.

Hewlett-Packard offers a Documentation Update Service that will provide you with further updates as they become available. If you operate or service instruments of different serial prefixes, we strongly recommend that you join this service immediately to ensure that you manual is kept current. For more information, refer to the Documentation Update Service reply card included in this manual, or call: Technical Writing Department (509) 922-4001,

or write:

Hewlett-Packard Company Technical Writing Department 24001 E. Mission - TAF C-34 Spokane, WA 99220

MECHANICAL AND CHASSIS PART LOCATIONS AND REFERENCE DESIGNATIONS

Most mechanical parts are identified in Figures 6 to 10. These figures are located at the end of this section. Major mechanical parts have reference designations that begin with the letters MP. To find the part number and description of a mechanical part, find the part in one of the photographs or drawings, and then look up the reference designation in Table 5. Mechanical hardware not shown in the figures, such as screws, are listed under the part which they attach. For example, the screws that attach the fan (B1) to the rear panel are listed under B1. Many of the cable assemblies have their reference designation (for example, W21) and color codes (WHT/ORN) silkscreened on the board assembly next to the connector to which they attach. Since these cables are indicated in this way, their reference designators are not called out in the photographs.

RECOMMENDED SPARES LIST

Stocking spare parts for an instrument is often done to ensure quick return to service after a malfunction occurs. Hewlett-Packard has prepared a "Recommended Spares" list for this instrument. The contents of the list are based on failure reports and repair data. Quantities given are for one year of parts support. You can request a complimentary copy of the "Recommended Spares" list from your nearest Hewlett-Packard office.

When stocking parts to support more than one instrument or to support a variety of Hewlett-Packard instruments, it may be more economical to work from one consolidated list rather than simply adding together stocking quantities from the individual instrument lists. Hewlett-Packard will prepare consolidated "Recommended Spares" lists for any number or combination of instruments. Contact your nearest Hewlett-Packard office for details.

HP 11848A Replaceable Parts

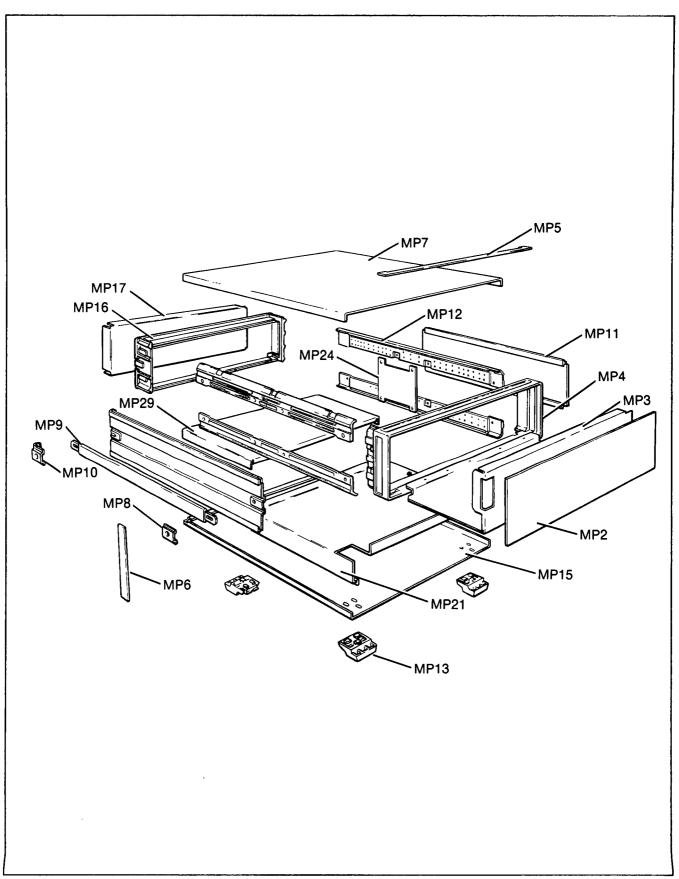

Figure 6. Cabinet Parts

Table 7. Update Information for Instrument Changes

Reference Designator	Serial Prefix	Description of Change
A1S1, A1S2, A1S3	2720A	Instruments with serial prefixes prior to 2720A have components A1S1, A1S2 and A1S3 installed. These switches are not used, and if improperly set can cause the instrument to malfunction. Any or all of the switches may be removed without affecting the operation of the instrument. These switches are not loaded in instruments with serial prefixes 2720A and above.

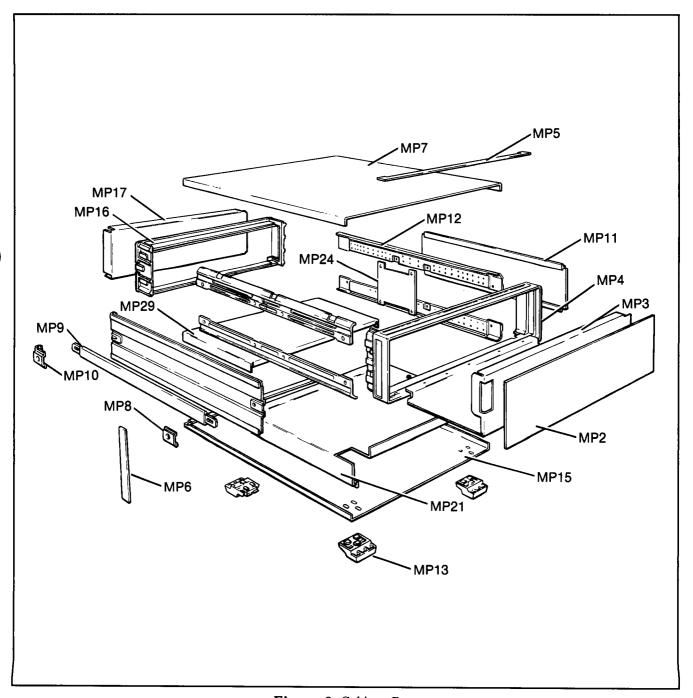

Figure 6. Cabinet Parts

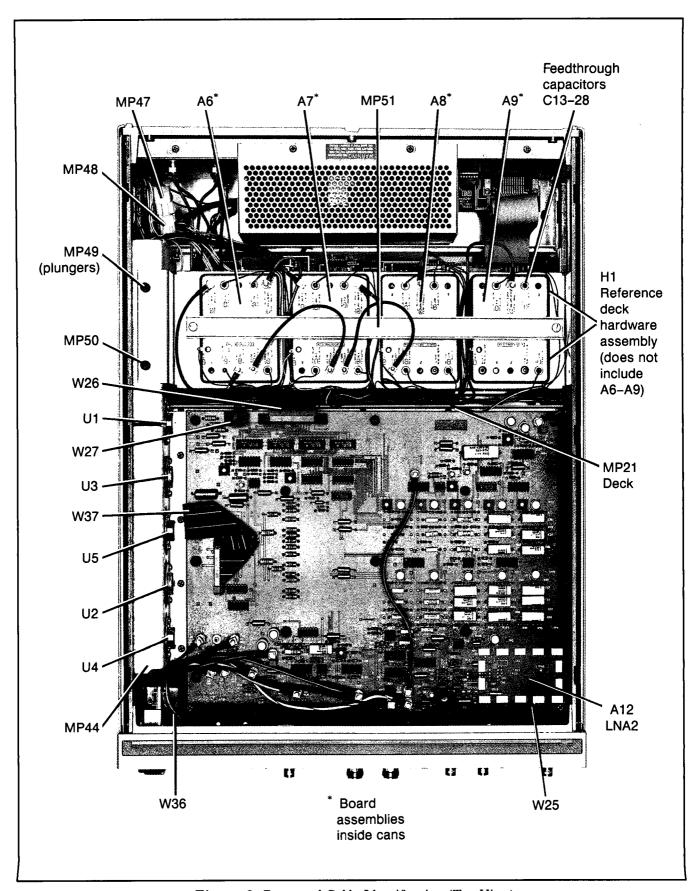

Figure 8. Parts and Cable Identification (Top View)

rev.21SEP89 73

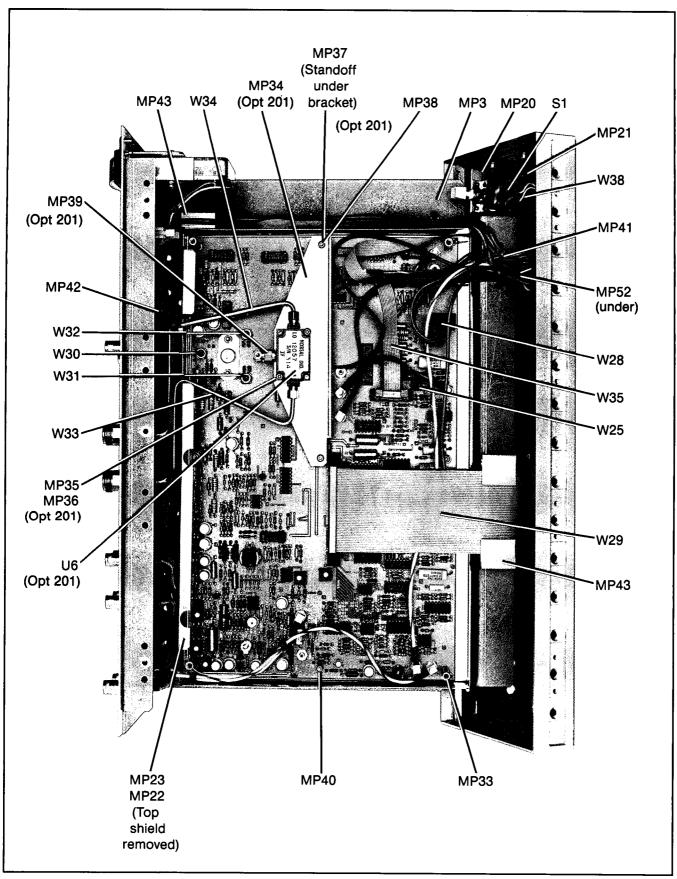

Figure 9. Parts and Cable Identification (Top View)

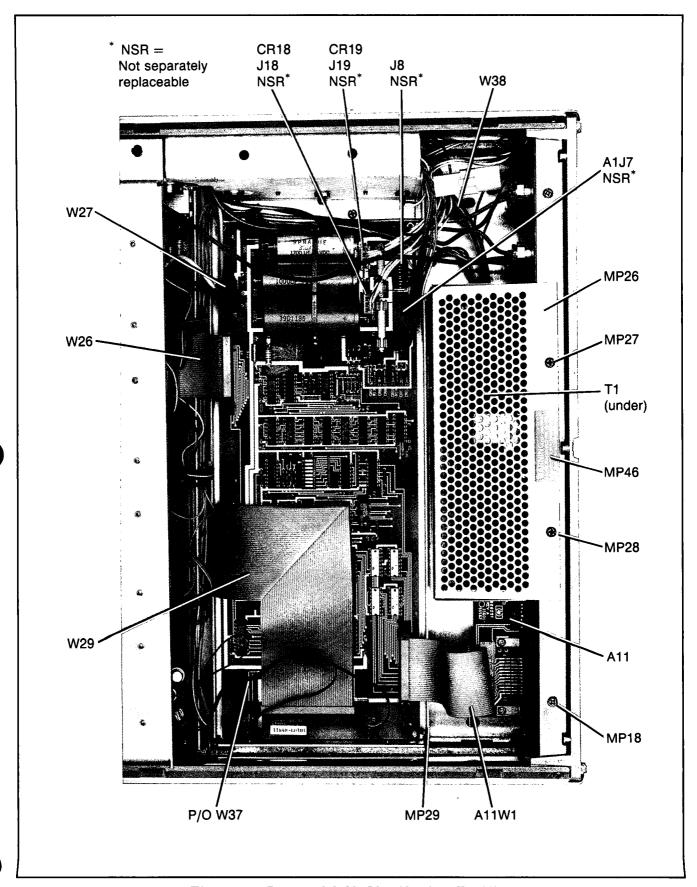

Figure 10. Parts and Cable Identification (Top View)

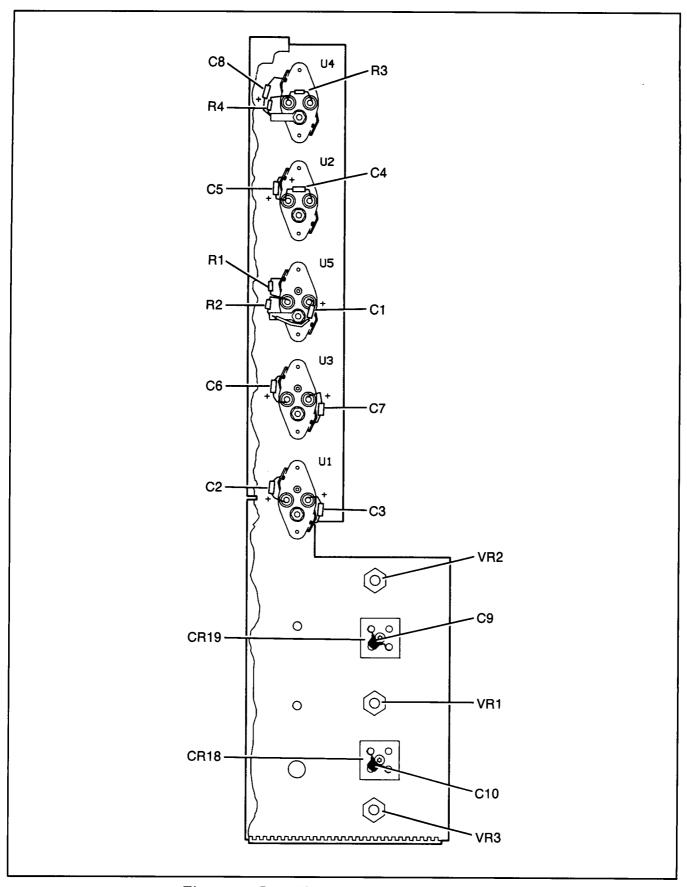

Figure 11. Parts Identification (Regulator Assembly)

Model 11848A Schematic Notes

To replace reference deck assembly:

Insert two small posts on right side of reference deck into bottom row of holes in top side rail. Line up black plastic plungers with their mounting holes.

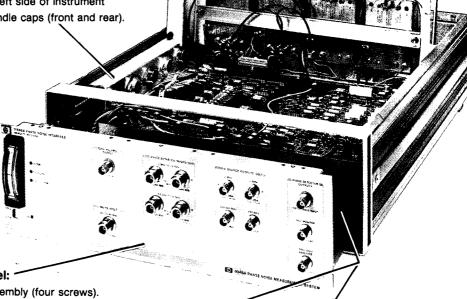

Press left side and plungers down into place.

To access A1 Assembly:

Pull up the two black plastic plungers on left side of reference deck and lift out reference deck assembly (A6-A9). Insert small post on right side of reference deck into hole in top row of side rail. Slide left side of reference deck into slot in bracket to stand upright.

To Access Power Supply Regulators:

Remove strap handle on left side of instrument (two screws). Remove handle caps (front and rear). Remove left side cover.

To close the front panel:

Replace shield on A4 Assembly (four screws). Align edges of deck with tracks in instrument and push front panel into place.

To remove A4 Assembly

- 1. Remove all flexible coax and ribbon cables.
- 2. Remove 5 screws mounting A4 Assembly to deck (3 screws, Option 201).
- For Option 201 instruments remove semi-rigid cables W34, W35, right angle adapter, and two screws mounting mixer bracket.
- Remove standoffs from four corners of A4 Assembly.
- Disconnect semi-rigid cables W31 and W32 from their front panel connections J3 and .15
- 6. Disconnect semi-rigid cable W30.

NOTE

J1 (TUNE VOLTAGE OUTPUT) and J11 (TO HP 3561A INPUT) are not connected to chassis ground.

To access A4 Assembly:

Remove plastic trim strip from top of front frame.
Remove three screws in top of front frame.
Remove three screws in bottom of front frame. Pull front panel out. Remove shield from A4 Assembly (four screws).

To replace A4 Assembly:

Reverse the order of the steps in the A4 removal procedure to replace the A4 Assembly.

Caution

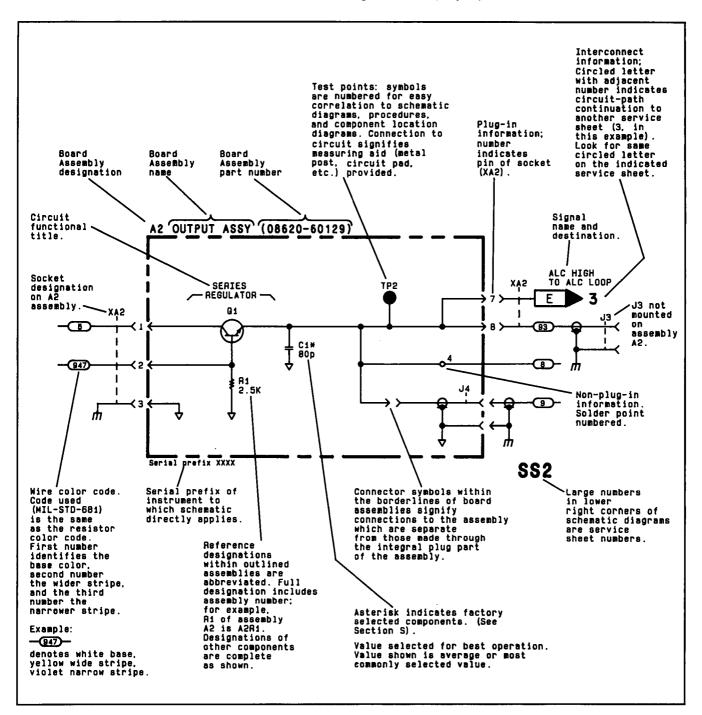

The A4 Assembly should slide toward the rear of the instrument as this semi-rigid cable is loosened. If it does not, check to be sure that all mounting hardware (screws and standoffs) for A3 Assembly is removed. Schematic Notes Model 11848A

SCHEMATIC SYMBOLOGY AND SCHEMATIC DIAGRAM NOTES

Table 8 summarizes the symbology used in presenting many devices found in the instrument. The logic symbols used in this manual are based on the Institute of Electrical and Electronic Engineers (IEEE) in IEEE-STD 91-1984, *Graphic Symbols for Logic Functions*. This publication may be purchased from:

Institute of Electrical and Electronic Engineers 345 East 47th Street New York, NY 10017

Table 8.Schematic Diagram Notes (1 of 11)

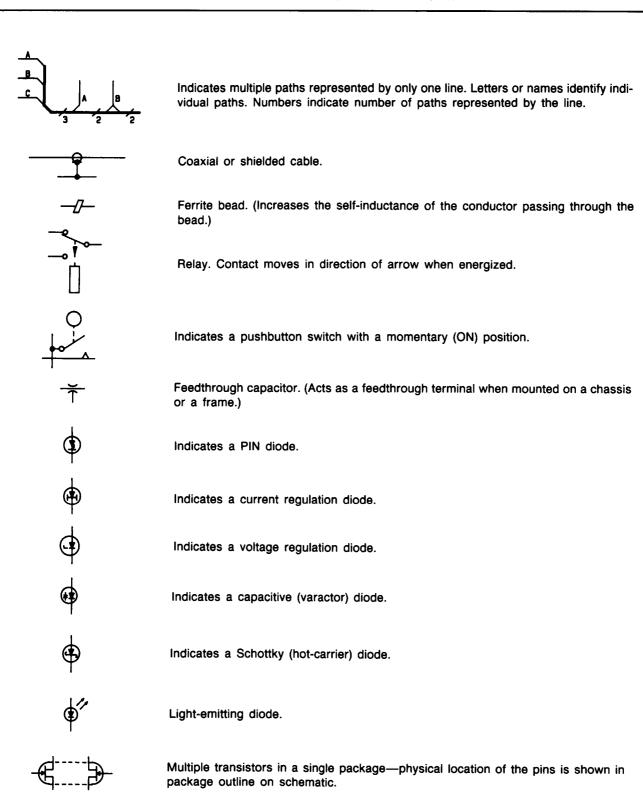

Model 11848A Schematic Notes

Table 8. Schematic Diagram Notes (2 of 11)

*	Asterisk denotes a factory-selected value. Value shown is typical. See Section V.
\otimes	Tool-aided adjustment.
	Encloses front-panel designation.
[===]	Encloses rear-panel designation
	Circuit assembly borderline.
	Other assembly borderline.
	Heavy line with arrows indicates path and direction of main signal.
	Heavy dashed line with arrows indicates path and direction of main feedback.
	Indicates stripline (i.e., RF transmission line above ground).
ICH	Wiper moves toward cw with clockwise rotation of control (as viewed from shaft o knob).
TP1	Numbered Test Point measurement aid provided.
-0-	Encloses wire or cable color code. Code used is the same as the resistor color code First number identifies the base color, second number identifies the wider stripe, and the third number identifies the narrower stripe, e.g., (247) denotes white base, yellow wide stripe, violet narrow stripe.
Ť	A direct conducting connection to earth, or a conducting connection to a structure that has a similar function (e.g., the frame of an air, sea, or land vehicle).
Ж	A conducting connection to a chassis or frame.
\downarrow	Common connections. All like-designation points are connected.
— <u> </u>	Letter = off-page connection. Number = Service Sheet number for off-page connection. In the example, signal flow is continued on Service Sheet 12, at the poin marked
THIS PAGE	Number (only) = on-page connection.

Table 8. Schematic Diagram Notes (3 of 11)

Identification of logic families as shown (in this case, ECL).

Model 11848A Schematic Notes

Table 8. Schematic Diagram Notes (4 of 11)

DIGITAL SYMBOLOGY REFERENCE INFORMATION **Input and Output Indicators** Implied Indicator—Absence of polarity indicator (see below) implies that the active state is a relative high voltage level. Absence of negation indicator (see below) implies that the active state is a relative high voltage level at the input or output. Polarity Indicator—The active state is a relatively low voltage level. Dynamic Indicator—The active state is a transition from a relative low to a relative high voltage level. Inhibit Input—Input that, when active, inhibits (blocks) the active state outputs of a digital device. Analog Input—Input that is a continuous signal function (e.g., a sine wave). Polarity Indicator used with Inhibit Indicator—Indicates that the relatively low level signal inhibits (blocks) the active state outputs of a digital device. Output Delay-Binary output changes state only after the referenced input (m) returns to its inactive state (m should be replaced by appropriate dependency or function symbols). Open Collector Output. Open Emitter Output. Three-state Output—Indicates outputs can have a high impedance (disconnect) state in addition to the normal binary logic states.

Table 8. Schematic Diagram Notes (5 of 11)

DIGITAL SYMBOLOGY REFERENCE INFORMATION

	Combinational Logic Symbols and Functions
Σ	Summing Junction—Outputs added together at a common point.
&	AND—All inputs must be active for the output to be active.
≥1	OR—One or more inputs being active will cause the output to be active.
≥m	Logic Threshold—m or more inputs being active will cause the output to be active (replace m with a number).
=1	EXCLUSIVE OR-Output will be active when one (and only one) input is active.
=m	m and only m—Output will be active when m (and only m) inputs are active (replace m with a number).
=	Logic Identity—Output will be active only when all or none of the inputs are active (i.e., when all inputs are identical, output will be active).
	Amplifier—The output will be active only when the input is active (can be used with polarity or logic indicator at input or output to signify inversion).
X/Y	Signal Level Converter—Input level(s) are different than output level(s).
	Bilateral Switch—Binary controlled switch which acts as an on/off switch to analog or binary signals flowing in both directions. Dependency notation should be used to indicate affecting/affected inputs and outputs. Note: amplifier symbol (with dependency notation) should be read to indicate unilateral switching.
X→Y	Coder—Input code (X) is converted to output code (Y) per weighted values or a table.
(Functional Labels)	The following labels are to be used as necessary to ensure rapid identification of device function.
MUX	Multiplexer—The output is dependent only on the selected input.
DEMUX	Demultiplexer—Only the selected output is a function of the input.
CPU	Central Processing Unit

Table 8. Schematic Diagram Notes (6 of 11)

DIGITAL SYMBOLOGY REFERENCE INFORMATION

	Sequential Logic Functions
1	Monostable—Single shot multivibrator. Output becomes active when the input becomes active. Output remains active (even if the input becomes inactive) for a period of time that is characteristic of the device and/or circuit.
	Oscillator—The output is a uniform repetitive signal which alternates between the high and low state values. If an input is shown, then the output will be active if an only if the input is in the active state.
FF	Flip-Flop—Binary element with two stable states, set and reset. When the flip-flop is set, its outputs will be in their active states. When the flip-flop is reset, its outputs will be in their inactive states.
Т	Toggle Input—When active, causes the flip-flop to change states.
S	Set Input—When active, causes the flip-flop to set.
R	Reset Input—When active, causes the flip-flop to reset.
J	J Input—Analogous to set input.
κ	K Input—Analogous to reset input.
D	Data Input—Always enabled by another input (generally a C input—see Dependency Notation). When the D input is dependency-enabled, a high level at D will set the flip-flop; a low level will reset the flip-flop. Note: strictly speaking, D inputs have no active or inactive states—they are just enabled or disabled.
+m	Count-Up Input—When active, increments the contents (count) of a counter by "m" counts (m is replaced with a number).
_ -m	Count-Down Input—When active, decrements the contents (count) of a counter by "m" counts (m is replaced with a number).
→m	Shift Right (Down) Input—When active, causes the contents of a shift register to shift to the right or down "m" places (m is replaced with a number).
←m	Shift Left (Up) Input—When active, causes the contents of a shift register to shift to the left or up "m" places (m is replaced with a number).
	NOTE
	For the four functions shown above, if m is one, it is omitted.
(Functional Labels)	The following functional labels are to be used as necessary in symbol build-ups to ensure rapid identification of device function.
mCNTR	Counter—Array of flip-flops connected to form a counter with modules m (m is replaced with a number that indicates the number of states: 5 CNTR, 10 CNTR, etc.).

Table 8. Schematic Diagram Notes (7 of 11)

	DIGITAL SYMBOLOGY REFERENCE INFORMATION
	Sequential Logic Functions (Cont'd)
REG	Register—Array of unconnected flip-flops that form a simple register or latch.
SREG	Shift Register—Array of flip-flops that form a register with internal connections that permit shifting the contents from flip-flop to flip-flop.
ROM	Read Only Memory—Addressable memory with read-out capability only.
RAM	Random Access Memory—Addressable memory with read-in and read-out capability.
	Dependency Notation
Cm	Control Dependency—Binary affecting input used where more than a simple AND relationship exists between the C input and the affected inputs and outputs (used only with D-type flip-flops).
Gm	Gate (AND) Dependency—Binary affecting input with an AND relationship to those inputs or outputs labeled with the same identifier. The m is replaced with a number or letter (the identifier).
Vm	OR Dependency—Binary affecting input with an OR relationship to those inputs or outputs labeled with the same identifier. The m is replaced with a number or the letter (the identifier).
mAm	Address Dependency—Binary affecting inputs of affected outputs. The m prefix is replaced with a number that differentiates between several address inputs, indicates dependency, or indicates demultiplexing of address inputs and outputs. The m suffix indicates the number of cells that can be addressed.
ENm	Enable Dependency—Binary affecting input which, when active enables all outputs. When inactive open-collector and open-emitter outputs are off, and three-state outputs are at an external high impedance state.
	When the enable input affects only certain inputs and outputs, they will be numbered to indicate the logic connection.
Xm	Transmission Dependency—Binary affecting input which bidirectionally connects dependent inputs and outputs.
Mm	Mode Dependency—Binary affecting input used to indicate that the effects of particular inputs and outputs of an element depend on the mode in which the element is operating. The m is replaced with a number or letter (the identifier).
Zm	Interconnection Dependency—Indicates the existence of internal logic connections between inputs, outputs, internal inputs, and/or internal outputs. The m is replaced with a number (the identifier).
,	Comma—AND Function.
1	Slant—OR Function.
	NOTE
	The identifier (m) is omitted if it is one—that is, when there is only one dependency relationship of that kind in a particular device. When this is done, the dependency indicator itself (G, C, EN, or V) is used to prefix or suffix the affected (dependent) input or output.

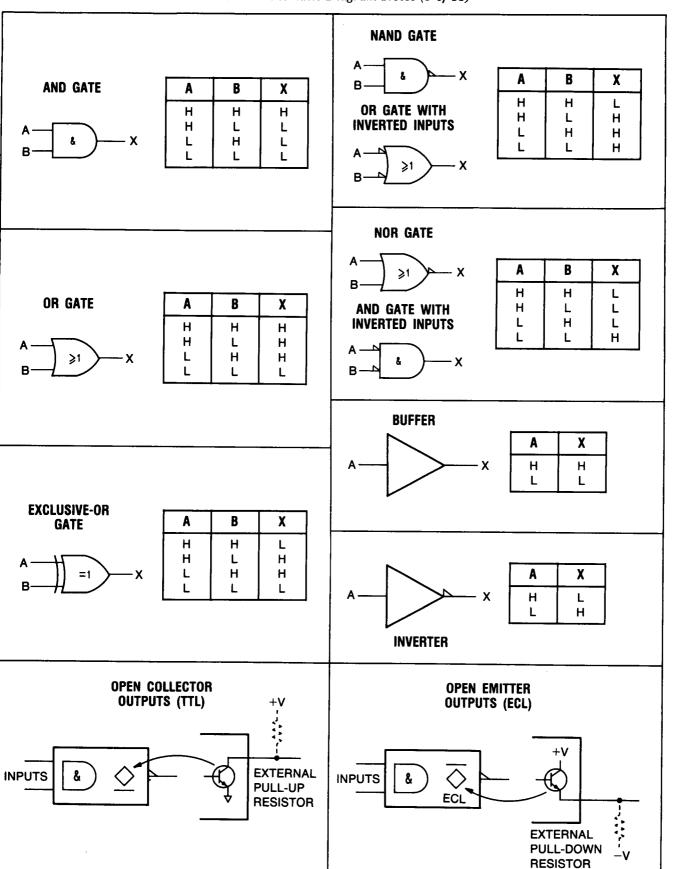

Model 11848A Schematic Notes

Table 8. Schematic Diagram Notes (8 of 11)

	Table 8. Schematic Diagram Notes (8 of 11)		
DIGITAL SYMBOLOGY REFERENCE INFORMATION			
Ш	Miscellaneous Schmitt Trigger—Input characterized by hysteresis; one threshold for positive going signals and a second threshold for negative going signals.		
Active	Active State—A binary physical or logical state that corresponds to the true state of an input, an output, or a function. The opposite of the inactive state.

Table 9. Cross Reference Index

Reference Designator	Assembly Name	Schematic Service Sheet Number	Parts List Page No.
A 1	HP-IB Interfacing/Power Supply Assembly	A1a, A1b	27
A2	LED Assembly	A4b	30
A3	Analyzer Interface Assembly	A3a, A3b, A3c	31
A4	Phase Detector Assembly	A4a, A4b, A4c, A4d	39
A 5	Not Assigned		
A6	10 MHz VCXO A Assembly	A6	51
A7	10 MHz Modulated VCXO B Assembly	A7	54
A8	350-500 MHz VCO Assembly	A8	57
A9	400 MHz Oscillator Assembly	A9	59
A10	Line Power Module	A1b	61
-A11	HP-IB Connector Assembly	A1a	62
A12	LNA2 Assembly	A12	62.1
i	1	I	

- Switches on the Block Diagram are shown in their HP-IB preset state. At Interface turn-on with no controller connected, the power-up state is the same as the HP-IB preset state except:
 - a. ATTEN 1 is set to an open-circuit (non-programmable) state, and
 - b. the switches of cluster S5 through S8 are all open.
- 2. The transfer function of GAIN 2 also has a lead-lag response as follows:

3. The transfer function of Lag-Lead Network 1 is as follows:

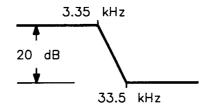

To this transfer function is added a programmable lag-lead with the following poles and zeros:

Lag-Lead Number	Pole Frequency	Zero Frequency	Attenuation
0	4.82 Hz	9.95 Hz	6 dB
1 1	8.01 Hz	40.1 Hz	14 dB
2	9.17 Hz	115.9 Hz	22 dB
3	9.68 Hz	306 Hz	30 dB
4	9.95 Hz	784 Hz	38 dB
5	9.95 Hz	1.985 kHz	46 dB
6	9.95 Hz	5.00 kHz	54 dB
7	9.95 Hz	12.58 kHz	62 dB

4. Assemblies A6, A8, and A9 are controlled as follows:

On the Line		State	
Control Line	A6	A8	A9
L17 L18 L17, L18	Off Off On	On On Off	On Off Off

The transfer functions of Lag-Lead Network 2 on A4 and the Lag-Lead Network on A3 are both as follows:

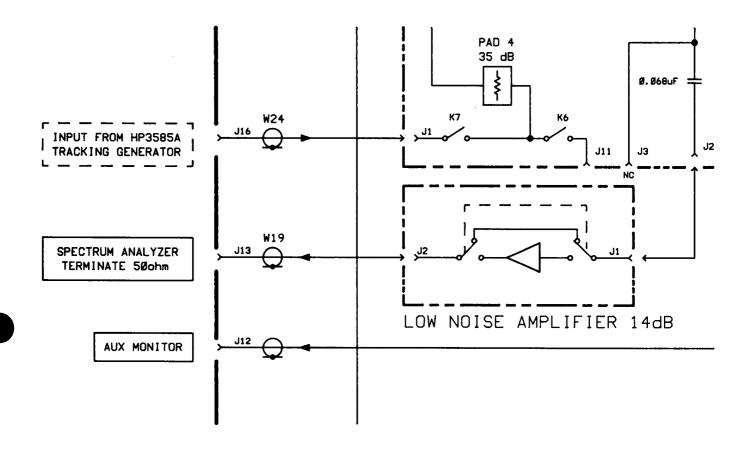

The passband gain of the High-Pass Filters is 2
 (as measured from TP17 to the respective filter
 output). The gain settings of the GAIN 3
 amplifier and attenuator include the passband
 gain of the High-Pass Filters.

3048MS-02

Situation:

In some applications using an unmodifed 11848A, where the peak tuning range is typically greater than 50 MHz, the phase lock loop (PLL) may not lock up. If it does lock up, there may be an otherwise unexplained noise peak displayed in the plot of phase noise for the device under test (DUT). This noise peak may have the appearance of a wide spurious signal several dB above the average noise floor, and typically shows up at an offset from the carrier of about 500 KHz to 2 MHz.

Starting in November 1992, the A3 board (p/n 11848-60203) in new 11848As was modified by cutting a trace. This eliminated a feedback path that was either generating noise or preventing lockup of the phase lock loop. While this modification did not affect the application measurement software for the 3048A, it did impact some test programs.

The 3048A Functional test #4 (Lag-Lead Transfer Functions Test) may fail depending upon what software revision is being used (see below).

Page 2 Service Note 11848A-03

11848A Diagnostic Software Tests will always fail since they attempt to test a circuit that uses the cut trace, and this diagnostic software (now obsolete) was never revised.

On the A3 board (p/n 11848-60203), the trace was cut between U25 (15) and U30 (2) on the component side of the board. All boards shipped in 11848As, serial numbers 3138A00888 and up, were modified. In addition, all exchange assemblies (p/n 11848-69103) are being modified as they go through the repair process at the factory. Therefore, a user could send in a failed (unmodified) board for a different reason and receive a working modified one (cut trace) in return. Tests that did not fail previously may now fail.

Solution/Action:

This service note provides information on acceptable performance for the 11848A under certain known situations where some specific tests may fail but the 11848A is functioning normally. The user may either disregard test failures where the cause is known and the 3048A system is otherwise performing normally, or if that is unacceptable, the user may upgrade his 3048A software to the latest version.

Performance specifications and functionality of the 11848A are not affected by the cut trace since it was part of an unused circuit designed in for future enhancements of the 11848A that were never implemented. However, testing of that circuit was designed into the test software so some tests can fail.

For the 11848A Diagnostic program (now obsolete), some tests will always fail when the trace is cut since there was only one version of the program and it expects the trace to be a valid circuit path. The diagnostic program was only intended to be used as an aid for isolating failures uncovered by other means and not as a verification of system or instrument operational status. If the system checks in the 3048A software (as described in the 3048A System Calibration manual) all pass, and the system makes valid phase noise measurements, the results of the diagnostic tests can be ignored.

For Functional Test #4 (Lag-lead test), the test results are determined by the 3048A software revision as follows:

3048A RMB Software Rev A.02.0x and a cut trace on A3:

Functional Test #4 fails. However, if the 10 MHz A vs B test (Quick Check) passes, there is a very high confidence level (90%) that the lag-lead circuits are OK so the test is not really needed.

3048A RMB Software Rev A.03.00:

Functional Test #4 (under investigation) was removed from the software so as not to hold up release of this revision. Therefore a cut trace on A3 will not cause a functional test failure with this revision.

3048A RMB Software Rev A.03.0x and a cut trace:

Functional Test #4 (modified) was put back in the software at Rev A.03.01 & up, but now it does not test the path where the trace was cut so it should pass as long as nothing else is wrong with the instrument.

3048A DOS Software (Option 301) Rev A.00.02:

Same as for RMB software Rev A.02.0x.

Service Note 11848A-03 Page 3

3048A DOS Software (Option 301) Rev A.01.0x:

Same as for RMB software Rev A.03.0x.

CAUTION:

Customers and HP personnel should not automatically assume that an uncut trace on an unmodified 11848A is causing a problem they may be seeing. Only the specific symptoms noted above have a high confidence level of being corrected by cutting the subject trace.

Cutting the trace, if it does not fix the problem, may disrupt test continuity and, in some cases, service traceability. The new test failures may also then mask valid failures later on. It is recommended that the factory be contacted first and the problem discussed before cutting the trace. It may be that an invalid application is contributing to the problem or that a software upgrade may be a wiser solution. The 3048A software system checks described in the 3048A Calibration manual should run to verify system operation. HP customers can receive needed technical support through their closest HP Sales or Service office.
