1. Gamewell Serial Driver Description

The Gamewell Serial Driver allows the FieldServer to accept messages generated by a Gamewell 600 Series Panel as well as 'Smartnet Data Stream' messages generated by a Gamewell Smartnet terminal.

All Gamewell 600 Series Fire Alarm panels are equipped with a serial port, which produces panel, circuit or device status messages. This driver is designed to process these messages and store this status information in numeric form. The numeric value will indicate the type of event being reported and the storage location in the FieldServer's data arrays is (configurable &) dependent on the origin of the message (panel / circuit / device). Additional information such as event date and time and descriptions are ignored.

The driver is capable of supporting a panel configured to supervise the port by responding to the panel's supervision queries.

This is a passive client driver. The driver listens passively for unsolicited messages produced by the Gamewell panel. This definition is not strictly true because the driver is capable of sending the panel three messages: Ack, Silence and Reset.

Design Basis: Gamewell serial port protocol specification "IF 600r7 Message Stream" (not dated) and "SmartNet Data stream information" (not dated).

The driver is capable of exposing communication statistics in a FieldServer Data Array so that a remote device can monitor them.

2. <u>Driver Scope of Supply</u>

2.1 Supplied by FieldServer Technologies for this driver

FieldServer Technologies PART#	DESCRIPTION
FS-8917-16	RS-485/RS-232 Pigtail for RJ45 port
	Driver Manual.

2.2 Provided by user

	Gamewell Panel with SIM232 interface

FS-8700-83 Gamewell Page 2 of 24

3. Hardware Connections

The bridge is connected to the Gamewell panel as shown below.

Configure the Gamewell panel according to manufacturer's instructions

FS-8700-83 Gamewell Page 3 of 24

4. Configuring the FieldServer as a Gamewell Serial Driver Client

For a detailed discussion on FieldServer configuration, please refer to the FieldServer Configuration Manual. The information that follows describes how to expand upon the factory defaults provided in the configuration files included with the FieldServer (See ".csv" files on the driver diskette).

This section documents and describes the parameters necessary for configuring the FieldServer to communicate with a Gamewell Serial Driver Server

The configuration file tells the FieldServer about its interfaces, and the routing of data required. In order to enable the FieldServer for Gamewell Serial Driver communications, the driver independent FieldServer buffers need to be declared in the "Data Arrays" section, the destination device addresses need to be declared in the "Client Side Nodes" section, and the data required from the servers needs to be mapped in the "Client Side Map Descriptors" section. Details on how to do this can be found below.

Note that in the tables, * indicates an optional parameter, with the bold legal value being the default.

4.1 Data Arrays

Section Title		
Data_Arrays		
Column Title	Function	Legal Values
Data_Array_Name	Provide name for Data Array	Up to 15 alphanumeric
		characters
Data_Format	Provide data format. Each data array can	FLOAT, BIT, UInt16, SInt16,
	only take on one format.	Packed_Bit, Byte,
		Packed_Byte,
		Swapped_Byte
Data_Array_Length	Number of Data Objects. Must be larger	1-10,000
	than the data storage area required for	
	the data being placed in this array.	

Example

```
Data Arrays
//
Data Arrays
Data Array Name, Data Format,
                                 Data Array Length
DA_AI_01,
               UInt16,
                                      200
DA_AO_01,
                UInt16,
                                       200
DA DI 01,
                                       200
                Bit,
DA DO 01,
                                       200
                Bit,
```

FS-8700-83 Gamewell Page 4 of 24

4.2 Client Side Connections

Section Title]	
Connections		
Column Title	Function	Legal Values
Port	Specify which port the device is connected to the Bridge	P1-P8, R1-R2
Baud	Specify baud rate	2400
	The driver supports all standard baud rates 110 – 115200.	
	Gamewell panels only support a baud rate of 2400.	
Parity*	Specify parity	None
	The driver supports the following options. Even, Odd, None , Mark, Space	
	The Gamewell panels only support the use of no parity.	
Data_Bits*	Specify data bits	8
Stop_Bits*	Specify stop bits	1
Protocol	Specify protocol used	Gamewell
Handshaking*	Specify hardware handshaking	None
Poll _Delay*	Time between internal polls	0-32000 seconds default 1 second
IC_Timeout	This driver does not use an inter character timeout system. Failing to set the IC_Timeout to zero will result in driver errors.	0

Example

// Client Side Connections

Connections

Port, Baud, Parity, Protocol, Handshaking, Poll_Delay, IC_Timeout P8, 9600, None, Gamewell, None , 0.100s , 0

FS-8700-83 Gamewell Page 5 of 24

4.3 Client Side Nodes

Section Title		
Nodes		
Column Title	Function	Legal Values
Node_Name	Provide name for node	Up to 32 alphanumeric characters
Node_ID	Gamewell panel node address.	0-256
	The Node Id has no meaning when the FieldServer is connected directly to Gamewell panel. When connecting to a Gamewell panel directly always set the Node_ID to zero. When connecting to a Gamewell SmartNet terminal. The Node_ID is important and should correspond to the Node_ID's of the panel's connected to the SmartNet terminal.	
Protocol	Specify protocol used	Gamewell
Port	Specify which port the device is connected to the FieldServer. The use of R1 and R2 is only	P1-P8, R1-R2
	appropriate when a 232/485 converter is used. The Gamewell panels only have a 232 port available for connection.	

Example

// Client Side Nodes

Nodes

Node_Name, Node_ID, Protocol, Port

Panel1 , 0 , Gamewell, P8

FS-8700-83 Gamewell Page 6 of 24

4.4 Client Side Map Descriptors

FieldServer Related Map Descriptor Parameters

Column Title	Function	Legal Values
Map_Descriptor_Name	Name of this Map Descriptor	Up to 32 alphanumeric
		characters
Data_Array_Name	Name of Data Array where data	One of the Data Array names
	is to be stored in the Bridge	from "Data Array" section above
Data_Array_Location	Starting location in Data Array	0 to maximum specified in
		"Data Array" section above
Function	Function of Client Map	Passive, WRBC, WRBX
	Descriptor.	
	Reads (rdbc / rdb) are not	
	allowed. The use of WRBX is	
	recommended for the ack /	
	silence / reset functions. A	
	message will be generated	
	each time the value in the	
	associated array is updated	
	(even if the value stays the	
	same.)	

Driver Related Map Descriptor Parameters

Column Title	Function	Legal Values
Node_Name	Name of Node to fetch data from	One of the node names specified in "Client Node Descriptor" above
Data_Type	Data type	Any
		Alarms
	This parameter is only required	Faults
	for passive / server map	Events
	descriptors.	Bus
	The Date Town and township and the	Comm
	The Data Type determines the type of data that gets stored	Control
	when a message get received. The Data Type corresponds to the 'Status' field in a Gamewell message. Additional information is provided in section 6.2	Ack
		Signal Silence
		Troubles
		Supervisories
		Action_Numbers
	provided in decilon 6.2	Action_Bits
		Dump

FS-8700-83 Gamewell Page 7 of 24

Longth	Longth of Man Descriptor	1 – 1000
Length	Length of Map Descriptor	1 - 1000
	Controls how many elements of the data	
	array are controlled by the map	
	descriptor.	
Address	This commonly used parameter has no	0
7 (44) 666	meaning for this driver. If specified it is	
	best set to zero.	
Ckt	Specify the circuit number whose	Panel , 1 ,2 , 3 131
	message will get stored using this map	
	descriptor.	
	Use the keyword 'Panel' if the you wish	
	to store data from a panel. All messages	
	which do not contain the keyword 'Ckt' in	
	the action field are deemed to be panel	
	messages.	
	Valid panel numbers are 1-131	
Dev	The starting device number for the map	0 , 1 , 2 126
	descriptor. The length determines how	
	many devices can have their data stored	
	using this map descriptor.	
	Valid circuit numbers are 1-126 but this	
	driver allows a device number of zero to	
	allow for the storage of messages which don't specify a device number.	
	don't specify a device number.	
	Ту	
Clear_On_Reset		Yes, No
Store_As*	Only relevant when the	AsciiLog
	Data_Type='Dump'	ASCII
		Value
	This tells the driver to store ignored	
	messages in ASCII format or to dump	
Computed Fires*	them in ASCII format in the error log.	Doort
Gamewell_Func*	Only relevant when the function is write.	Reset Ack
	This parameter tell the driver what type	Silence
	of command to send to the panel.	- Chickles
	or communic to condito the parier.	
	You should always Ack before you	
	silence the panel.	

Timing Parameters

Column Title	Function	Legal Values
Scan_Interval	Rate at which data is polled	>0.1s

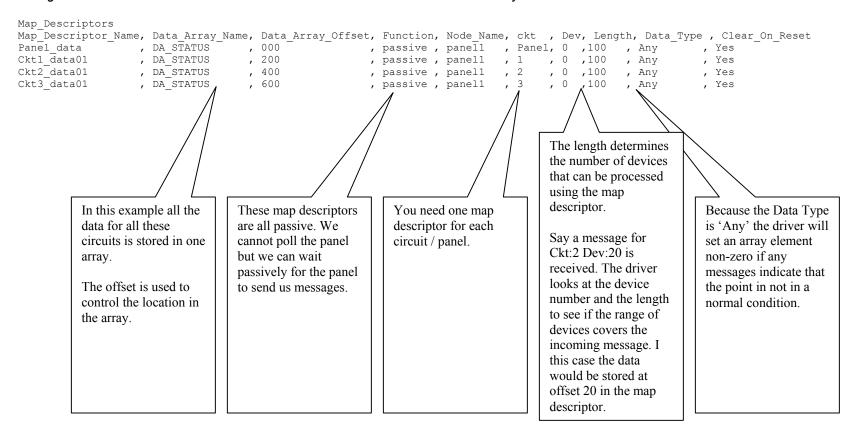

FS-8700-83 Gamewell Page 8 of 24

Map Descriptor Example 1 – Store data from incoming messages.

This example illustrates typical map descriptor uses to store data from panel generated messaged.

As all these map descriptors have their Clear_On_Reset field set to yes, when a panel reset message is received all the data in the controlled arrays will be set to zero When a point reports its own state as normal the driver will set the appropriate element of the appropriate array to zero to indicate the normal state..

Data is stored, first by finding a map descriptor with the correct circuit number. If the message doesn't contain a circuit number then it is assumed to be from the panel itself. If a message contain a CKT number and no DEV number then the driver assumes the device number is zero. The storage location is based on the device number – it is used as an offset into the array.

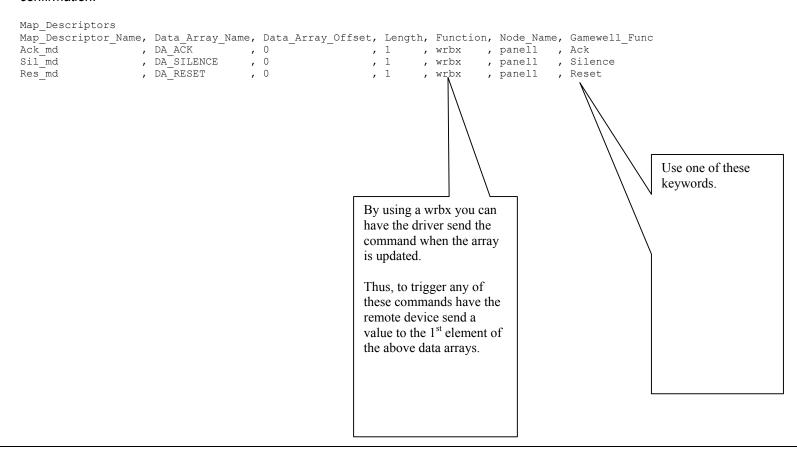

FS-8700-83 Gamewell Page 9 of 24

Map Descriptor Example 2 – Send a Reset / Ack / Silence Command.

This example illustrates three map descriptors used to send commands to the panel. These are the only active map descriptors that can be used with the Gamewell Serial Driver.

These map descriptors use the WRBX function. When the 1^{st} element (because Data_Array_Offset = 0) has its value updated, even if the value doesn't change, then the driver will send the command to the panel.

Note that you are required to send an Ack before you can send a silence command. The driver does not clear the trigger by setting the array element back to zero. The panel does not send a message acknowledging receipt of the command, thus the driver cannot provide positive confirmation.

FS-8700-83 Gamewell Page 10 of 24

5. Configuring the FieldServer as a Gamewell Serial Driver Server

The Gamewell Serial Driver provides limited server functionality. This has been developed to allows for automated testing and Quality Assurance. It is not supported or documented however, at a client's request it can be extended & documented (typically at an additional cost.)

6. Advanced Topics

6.1 Driver Limitations & Exclusions

The driver does not support scaling when data is stored in a data array. The keywords

'Data_Array_Low_Scale, Data_Array_High_Scale, Device_Low_Scale, Device_High_Scale'

have no meaning for this driver. The reason for this is that the values stored by the driver have specific meanings based on parsing the message. Scaling is only applicable in drivers which read and write values from the remote device.

6.2 Data Types

Notes:

Messages contain Status and Action information. The status information indicated the state of a device / circuit / panel. The action information describe the event that generated the message.

By specifying one of the following Data_Types you can filter the incoming messages so that on certain types of messages update certain data arrays. For example, if you are only interested in storing data from messages that report an alarm then set the Data_Tupe of that map descriptor to 'Alarms'. If you don't care about the particular state then use the Data_Type of 'Any'. The driver will set the values of the array elements non-zero if any not-normal states are reported.

Data_Type	Status	Note #
Any		1
Alarms	Status:ALARM	2
Faults	Status:FAULT	2
Events	Status:EVENT	2
Bus	Status:BUS	2
Comm	Status:COMM	2
Control	Status:CONTROL	2
Ack	Status:ACK	2
Signal Silence	Status:SIG SIL	2
Troubles	Status:FAULT	2
Supervisories	Status:EVENT and Action contains "Supv. Event in"	2
Action_Numbers		3
Action_Bits		4
Dump		5

FS-8700-83 Gamewell Page 11 of 24

- 1. If the Data Type is 'Any' then the map descriptor will be used to store data from message with any status.
- 2. The state reported is filtered and must match the Data_Type for the associated array to be updated. For example, if the Data_Type of a MapDesc is 'Alarms' and a message is received that reports a Fault then the map descriptor will not be used to store the data from the message.
- 3. Normally, user's are interested in the Status of a device / circuit / panel but they may also be interested in the cause (or the 'action' in Gamewell terminology) of the message. When you specify the Data_Type as 'Action Numbers' then the driver will store a value which can be used to look up the action that produced the message. The most recent action number is stored over any older value. (The driver does not provide an event log.)
- 4. Instead of storing a value to indicate the action, the driver can set a bit whose offset indicates the action. For example, action 30 will cause the 30th bit to be set. Action bits are stored retentively. This means that when a new action is reported the previous bits are left set and a new bit is set too.
- 5. What happens if a message arrives that reports an alarm and you don't have a map descriptor with a Data_Type capable of storing an alarm. You can make a catch all map descriptor and use the 'Dump' Data_Type to tell the driver to store the whole message in ASCII format in a data array so that you can inspect it. You can also use this map descriptor to tell the driver to dump the ignored message to the error log.

6.3 Status Types and Values

Generally, the driver stores non-zero values to indicate the state of a device / circuit / panel based on the 'status' field of the incoming message. The specific non-zero value can be found in the following table. The value have been chosen so that they correspond to different bits.

Status	Value Stored
Alarm	1
Fault	2
Event	4
Bus	8
Comm	16
Control	32
Ack	64
Sig Sil	128
Supv	512
Genr	1024

Thus if a map descriptor has its Data_Type = 'Any' and two messages are received, one an alarm and one an event, then the value of the array element will be set to 1 + 4 = 5. Thus the value is non-zero to report the not-normal state but inspection of the value allows you to determine the specific stat.

The value's can be changed by using the method below to add, but when you add, use the existing name and a new value.

FS-8700-83 Gamewell Page 12 of 24

When comparing these keywords to the data in the Status field of the message the driver only compares the first three characters. The comparison is case insensitive.

Adding a New Status Type

The fragment of a CSV file displayed below illustrates how to change the value associated with 'BUS' to 9 and adds two new Status types, Fred and Ginger.

```
Driver_Table

Gamewell_Status_String, Gamewell_Status_Value, Protocol

BUS , 9 , Gamewell

FRED , 100 , Gamewell

GINGER , 101 , Gamewell
```

There is a limitation in the use of new status types. They can only be stored using map descriptors with the Data_Type set to 'Any'.

The driver can store a maximum of 100 status types. The maximum length of the string is 9 characters.

6.4 When do Data Arrays get cleared (Reset)

When the Gamewell Panel is reset then the driver is able to clear the arrays. The way that the panel works is that when a reset is performed send the following message

```
Status:NORMAL 08/31/95 16:23
System Idle
```

After this message the panel then sends messages for all points that are not in a normal state.

The driver uses the parameter 'Clear_On_Reset' to determine what gets cleared. If a map descriptor has this parameter set to 'Yes' then the arrays elements controlled by the Data_Array_Offset and the Length are set to zero.

This provides a good technique of synchronizing the panel and the FieldServer. When you restart the FieldServer you should push the reset button on the panel so that the panel sends messages for all points that are not in a normal state. If you don't do this, and some points are in a not-normal state then the FieldServer will not know about them until their state changes This is potentially dangerous.

6.5 Action Types

Typically messages from the panel are contain not only the status of a point but also describe the action that caused the state to change.

FS-8700-83 Gamewell Page 13 of 24

Based on the table below if a message contains the string 'Fire Alarm in' then the action number will be stored as 11.

Adding new Action Types

The following fragment from a CSV file shows how you can add two new action types. If a message is received and its action field contains the text 'FRED' then the action number will be stored as 100.

```
Driver_Table

Gamewell_Action_String, Gamewell_Action_Value, Protocol

FRED , 100 , Gamewell

GINGER , 101 , Gamewell
```

The driver can store a maximum of 100 action types. The maximum length of the string is 49 characters.

FS-8700-83 Gamewell Page 16 of 24

6.6 Advanced Map Descriptor Examples

Example 1 : Filtering Data

You can direct the driver to filter the incoming messages so that data arrays are only updated for particular states. For example an incoming message which reports a device in Ckt 1 to be in a FAULT state (Status:FAULT) will use the map descriptor 'Ckt1_data03' to store the data and the array DA_FAULTS1 will be updated. If however, the message reported an ALARM state (Status:ALARM) then the array DA_ALRMS1 would have been updated.

In fact, because the examples below provide a map descriptor where the data type is 'Any', each incoming message would update two data arrays. The DA_Status1 array would be updated by every single message and the other arrays would be updated depending on the state being reported in the message.

```
Map Descriptors
                                                                                                                                                                                                                                                                                              , Clear on Reset

                                                                                                                                                                                                                             , 100 , Signal Silence , Yes
                                                                                                                                              , passive , panell , 1
                                                                                                                                                                                                                              , 100
                                                                                                                                                                                                                                                    , Troubles
```

You would need another set of these map descriptors for any other circuit you are monitoring.

only update the associated data arrays when the messages report a state that matches the data type. FS-8700-83 Gamewell Page 17 of 24

Example 2 : Action Numbers

You can have the driver store a value corresponding to the contents of the action field reported in the incoming messages. Actions are brief descriptions of the event that caused the message to be generated. A table of values vs. descriptions is provided in section 6.5. The driver stores the most recent action number, overwriting the previously stored action numbers. The driver does not keep an event log. The action number's are set to zero, if the clear on reset is set to 'yes' and a system reset message is received.

For example, if the string 'Fire Alarm in' is contained in the action field of the message the driver would store an action value of 11.

This map descriptor can be used as well as the any of the map descriptors shown in previous examples. Thus you can have one (or more) map descriptor storing the state and one storing the action number.

```
Map_Descriptors
Map_Descriptor_Name, Data_Array_Name , Data_Array_Offset, Function, node_name, ckt , Length , Data_Type , Clear_on_Reset Ckt1128_data12 , DA_ACTION128 , 000 , passive , panel1 , 128 , 127 , Action_Numbers , yes

Using this data_Type the driver stores a value corresponding to the contents of the action field portion of the message sent by the panel. A table in section 6.5 provides a list of values vs. action descriptions.
```

FS-8700-83 Gamewell Page 18 of 24

Example 3 : Action Bits

Instead of having the driver store a value to indicate the action, the driver can set a bit, whose offset indicates the underlying action. For example, if the string 'Fire Alarm in' is contained in the action field of the message the driver would set the array element at offset 11 (use table 6.5 to get the value vs. string) to 1.

Important to note is that the driver does not clear a previously set bit when a new action is reported. Thus if two messages were received and the first reported 'Fire Alarm in' and the second reported 'Supv. Event in' then first the array element at offset 11 would be set to 1 and then element at offset 12 would be set. The element at offset 11 would remain set. Both would then remain set until a system reset is performed, the state of the point returns to normal (status:NORMAL) or you clear the bits by writing to the array from the remote device.

As the driver may use up to 100 consecutive array locations for each Ckt/Device pair, if you use this method of storing data you will need one map descriptor for each Ckt/Device pair. In this example the map descriptor will store data for Ckt 128 device 10 only. This is indicated by the Ckt number being set to 128, the device number being set to 10 and the length being set to 1.

If the driver doesn't recognize the action type then it will set the array element at offset zero.

Map_Descriptors
Map_Descriptor_Name, Data_Array_Name , Data_Array_Offset, Function, Node_Name, Ckt, Dev, Length , Data_Type , Clear_On_Reset Ckt1128_data12 , DA_ACTION_BITS , 000 , passive , panel1 , 128, 10 , 1 , Action_Bits , yes

Only one device per map descriptor.

Ensure that at 100 elements of data array are available for each map descriptor. (100 is the maximum action number.)

FS-8700-83 Gamewell Page 19 of 24

Example 4: Ignored Messages

When messages are received that the driver cannot find a map descriptor to use to store the data from the message (say a message from a device on circuit 127 is received but there are no map descriptors for circuit 127) then the driver produces a MSG_IGNORED stat. You can have the driver dump these messages to the error log or store the message in a data array by using the DATA_Type='Dump'. If the data is stored in a data array then use a data array with a 'Byte' format and display the array using the ruinet utility and view the array in 'String' format. If youhave the ignored messages dumped to the error log then use the RuiDebug utility to capture the error log

7. Driver Notes

7.1IC_Timeout

The connection IC_Timeout must be set to zero. This is done in the CSV file by setting IC Timeout parameter.

The following fragment from a CSV file illustrates how this is done.

```
Connections
Port, Baud, Parity, Data_Bits, Stop_Bits, IC_Timeout
P1, 2400, None , 8 , 1 , 0
```

7.2 Driver Stats

In addition to the standard FieldServer communication statistics described in the FieldServer User's Manual, the Gamewell Serial Driver can also expose some driver statistics by writing data to a data array. A special map descriptor is required. The driver recognizes the map descriptor by its name which must be "Gamewell-stats" .

The following example shows how this special map descriptor can be configured. You can copy this section of text directly into your CSV file.

```
Nodes
Node_name, Node_ID, Protocol
dummy_node, 0 , Gamewell

Data_Arrays
Data_Array_Name , Data_Format, Data_Array_Length
DA_GAMEWELL_STATS, uint16 , 500

Map_Descriptors
Map_Descriptor_Name, Data_Array_Name , Data_Array_Offset, Function, node_name ,
Gamewell-Stats , DA_GAMEWELL_STATS, 0 , passive , dummy_node,
```

When the driver sees this map descriptor it uses the data array DA_GAMEWELL_STATS (in this example) to store driver specific statistics. Only one of these map descriptors may be specified per FieldServer.

The offset into the array is based on the port number. 30 arrays locations are used per port.

The offset is obtained by multiplying the port number by 30.

FS-8700-83 Gamewell Page 21 of 24

The driver stores the following data.

	PORT				Description		
0	1	2	3	. 8			
	Aı	rray (Offset				
0	30	60	90	240	Available for future use		
1	31	61	91	241	Available for future use		
2	32	62	92	242	Available for future use		
3	33	63	93	243	Available for future use		
4	34	64	94	244	Number of bytes sent by client driver		
5	35	65	95	245	Number of messages sent by client		
6	36	66	96	246	Number of reponse messages received by client		
7	37	67	97	247	Number of response bytes received by client

8. Revision History

Date	Driver Version	Document Revision	Resp	Comment
29May2002	1.00	0		Initial Release. Issued for review, formatting. Connection diagrams required.
13Jun2002	1.00	1		No Changes
19July2002	1.00	2		Releasing
18Sep2002	1.01	0		Added Status:SUPV support. Message that begin this way are stored as Supervisories (see section 6.3). Changes to 6.2 Reference to Supervisory Data Type Changes to 6.3 Reference to the value of a SUPV message.
25Nov02	1.02	0		Changes to 6.3 Refrence to value of A GENR message Changes to 6.4 "Commencing System Reset" clears arrays too. Changes to 6.5 Variations for action types 13/16
20Aug03	1.02	1	JD	Releasing
