User Manual

Thermal printer controller PRN607-S

FOR FUJITSU THERMAL PRINTERS FTP607MCLXXX SERIES

28-03-2003 Page 1-1 of 53

VERSION HISTORY

Version	Date	Init	Status	Description
1.0	030328	BB	Released	First release

Comments:

List of known missing parts:

- 1. Details for some ESC sequences are not specified.
- 2. Connector specification is not updated
- 3. IRDA specifications are not implemented.
- 4. Description of installed Font set missing.

Copyright 1999-2003 by I/F-COM A/S. All rights reserved.

I/F-COM A/S has prepared this manual for use by I/F-COM A/S' customers.

The information contained herein is the property of I/F-COM A/S and shall not be reproduced in whole or in part without the prior written approval of I/F-COM A/S.

I/F-COM A/S reserves the right to make changes without notice to the specifications and materials contained herein and shall not be responsible for any damages (including consequential) caused by reliance on the materials presented, including but not limited to typographical, arithmetic, or listing errors.

Safety Precautions

- Please read and understand these specifications thoroughly before using the printer. Please keep the specifications carefully in a place where they may be easily consulted when the printer is used.
- Please do not modify or service this printer as this may cause unpredictable faults to occur.

- The product is not intended to be installed in devices such as those used in life-support medical equipment, undersea relays, and aerospace applications or for nuclear power control, in which extremely high reliability is required. If you are considering such applications, please consult our customer service department.
- There is a general possibility of component failure. Every effort has been made to improve product quality but such failures cannot be completely excluded. Please assume that such failure may occur before using this printer.

We would urge that these specifications should be thoroughly understood and the printer used safely in your company or associated organisation. Please indicate or describe in your products and in the user manuals those items, which are related to the prevention or avoidance of danger and draw these to the attention of the eventual client (the user).

1 SYSTEM DESCRIPTION

This reference manual describes the specifications, functions, and operating procedures for the PRN607-S Interface Board.

The PRN607-S is an interface board for the FTP607MCLxxx series printer mechanisms.

This reference manual also describes the print operation of the FTP607MCLxxx. Read this reference manual thoroughly before using the PRN607-S. PRN607-S is designed for the following Fujitsu printers:

FTP627MCLxxx FTP637MCLxxx

PRN607-S consists of an interface board. The communication is RS232, USB or IRDA. PRN607-S can print graphic data either compressed or non-compressed. Burn time can be set to control the printing intensity Windows 95/98, 2000, NT and CE drivers are available at http://www.if-com.com, for easy operation by PC. Linux drivers are available upon request.

2 INSTALLATION

2.1 Unpacking

Remove the cover observing precautions for Electro Static Discharge (ESD). Make sure that board is handled with care with respect to Electrostatic environment.

2.2 Labels

PRN607-S has 3 labels;

Label 1 on backside ex. Ifxxxxx is a unique ID number. For service and question based upon 1 particular board please refer to this number. Label 2 on topside ex. PRN607-S is part number. Please refer to this number upon reordering. Make sure that software revision is applied at same time.

Label 3 is an internal code. Please ignore.

2.3 Installation

PRN607-S is fastened in the product by 4 M3.3 screws. The cables (for the thermal head, the stepper-motor and detector) are placed in the thermal printer connector on the PCB. 1 Mounting hole is grounded. See drawing for more details.

28-03-2003 Page 2-7 of 53

- (a) To connect or remove the connector, always turn off the power in advance. If the connector is connected or removed while the power to the printer is on, errors may occur.
- (b) The connector of each cable must be correctly locked and connected. The connector at the head side has no lock feature. Check that the connector at the head side is completely inserted.
- (c) To install the interface, carefully check each cable so that excessive force is not applied to each cable. Especially, carefully check the head connection cable because it affects the head pressure force. If the print head connector is not completely connected, overheating or burning may occur in the print head.
- (d) Be sure to add grounding cable from printer body to interface ground. Make sure that ground is present at any mechanical settings, like head up and paper out.

2.4 **Power supply**

Single power supplies for the PRN607-S controller board. Voltage range is 18-26VDC. 5A minimum @ 24V. Make sure that voltages never exceed 26VDC.

- (a) The power supply unit that satisfies the specified specifications must be used. If a power supply unit that does not satisfy the specified specifications is used, normal operation is not assured and errors may occur.
- (b) To turn on or off the power, a protective circuit must be mounted on the control board in advance. For safety, the following voltage change conditions must be satisfied:

2.5 Settings

Following below description can change default settings. Baud rate is default 115.200, however standard PC's today cannot handle this Baud rate. Windows OS does not support speed higher than 115.200 Baud, even when setup menus can be set to higher speed. In order to obtain higher

28-03-2003 Page 2-8 of 53

speed you need to install 3rd part utility program on PC. Please visit <u>www.if-</u> <u>com.com</u> for further information.

- 1. Turn off power
- 2. Press Key 1 low while power up. Board is now in setting mode. Text will be printed on paper for further information
- 3. By activating key 1 and 2 you can change following parameters:
 - a. Test printout
 - b. Select Command set
 - i. I/F-COM command set (Default)
 - ii. Seiko compatible command set (Optional)
 - iii. Fujitsu compatible command set (Optional)
 - iv. APS compatible command set (Optional)
 - v. ESC/POS compatible command set (Optional)
 - c. Baud rate
 - i. 9600

Settings will be effective upon turn off and on.

2.6 Serial Input/Output

If BUSY control is selected:

When 236 bytes of data have been stored in the input buffer, the SBUSY signal becomes high to request that the computer temporarily stop sending data. When the amount of data stored in the input buffer becomes 235 bytes or less, the SBUSY signal changes to low to request that the host device continue data transfer. Up to 16 bytes of input data are guaranteed after the SBUSY signal has become high. When an error occurs, the SBUSY signal becomes high. Data input is prohibited until the error is cancelled.

If Xon/Xoff control is selected:

When 188 bytes of data has been stored in the input buffer, Xoff (13_{16}) is output through the TxD terminal to request that the host device temporarily stops sending data. When the amount of data stored in the input buffer becomes 124 bytes or less, Xon (11_{16}) is output to request that the computer continues data transfer. Up to 64 bytes of the input data are guaranteed after

Xoff has been output. When an error occurs, the Xoff signal is output to prohibit the data input.

When the error is cancelled, Xon is output.

2.6.1 Serial data transfer

The PRN607-S transfers various data other than the Xon and Xoff codes which are output when controlling Xon and Xoff.

Regardless of whether the input mode is serial or parallel, the following data is transferred through the TxD terminal.

(a) Error codes when a hardware error occurs at initialisation

(b) The data when executing the Vhead voltage response

(c) The data when the error status response is set and an error occurs

(d) The data when executing the execution response request

(e) The data when executing the remaining RAM capacity response

(f) The data when executing the environmental temperature response At the selection of serial input, data (b) through (f) is transferred according to the transfer conditions, which are set using the function switches. However, the hardware error code (a) has the same conditions as those for parallel input.

When transferring data, data control by SBUSY and Xon/Xoff is not executed and the data is transferred with no conditions.

All of the transmission conditions of serial data transfer for sending hardware error codes are fixed at the selection of parallel input as follows:

Baud rate: 115.200bps Parity: none Bit length: 8 bit Stop bit: 1 bit

2.6.1.1 Serial input/output port

Serial data output (TxD)

When Xon/Xoff control is selected, the Xon/Xoff signal is output. Data is output according to the transmission conditions, which are set by the function switches.

All response data is output.

Serial data input (RxD)

Data input port

Data is input from the host device according to the transmission conditions, which are set using the function switches.

Serial busy (SBUSY)

Indicates whether or not the PRN607-S is ready to receive data. When the SBUSY signal is low, data can be input.

When Xon/Xoff control is selected, SBUSY is always low.

2.6.2 Setting functions

Error processing when receiving serial data The PRN607-S receives and checks serial data according to the transmission conditions. When the PRN607-S has received one byte of data without errors, the data is stored in the input buffer. If there are any errors, the following data is stored in the input buffer according to the type of error. Error type Error code Parity error (!: 21₁₆)

) I/F-COM

Framing error (?: 3F₁₆)

If the input data cannot be printed correctly and instead "!" or "?" is printed, the transmission conditions between the host device and the PRN607-S most likely does not match. If this happens, adjust the conditions so that they match.

2.6.3 Thermal Head Control

Data Transfer to the Thermal Head

The PRN607-S transfers one dot line of data at 4 Mbps synchronized with the CLOCK signal.

The data is transferred in order to the shift register inside the thermal head from the left (when facing the paper feed direction).

The transferred data is then transferred by the head latch signal to the latch register inside the thermal head. Turning on the head strobe signal initiates printing of one dot line of data on the thermal paper.

2.6.4 Thermal Head Drive Operation

Generally, when the line thermal head is operating, the line is divided into several blocks, which are activated one after another in succession. For the line thermal head of the FTP607MCLxxx printer mechanism, the line is divided into 3 blocks called physical blocks, 64 dots with each. A strobe signal (DST1 to DST3) is allocated to each physical block to activate it. To drive the head, physical blocks are activated in groups. The group of physical blocks is called a logical block.

For the PRN607-S either dynamic division or fixed division can be selected as the method of division for logical blocks. This selection is made through a function. See settings for more information.

2.6.5 Peak power limitation

The PRN607-S counts the number of dots activated in each physical block and groups the physical blocks into logical blocks to print a single dot line so that the number does not exceed the specified maximum number of activated dots. The PRN607-S determines logical blocks each time it prints a single dot line.

In dynamic division, in order to avoid unclear printing, at the first step of the motor the thermal head is driven and at the second step the paper is fed. Also, since the order of the printing blocks and printing speed are changed in each dot line according to the content of the print data, print quality may be lower than that in fixed division. If print quality is regarded as important, printing in fixed division is recommended.

The maximum number of activated dots in the initialisation status is specified using the function switches.

28-03-2003 Page 2-13 of 53

64 through 256 dots can, however, are set using the command for setting the number of dynamic division dots.

When the maximum number of activated dots is 128 dots, and all of the dots are driven, as shown in

2.6.6 Head Control Circuit

The PRN607-S has a function for measuring the resistance of the thermal head connected to the FTP607MCLxxx.

The PRN607-S measures the resistance of the thermal head and detects the errors at initialisation.

Based on the measurement, the PRN607-S determines how much energy to apply. No adjustment is needed for replacing the FTP607MCLxxx to get the best printing.

2.6.7 Head temperature measurement circuit

The thermistor is mounted on the FTP607MCLxxx to measure the temperature of the thermal head.

The PRN607-S determines the energy to be applied to the head and also checks for head temperature errors.

If the temperature of the thermal head is -10 °C or lower, or 80 °C or higher, the PRN607-S stops driving and puts the printer in head temperature error status. If the temperature of the thermal head is returned to from -5 °C to 75 °C, the printer goes to printable status.

2.6.8 Vhead interrupt circuit

This circuit interrupts Vhead to prevent electrolytic corrosion of the thermal head and to enable the detection of the resistance mentioned above. Electrolytic corrosion may significantly shorten the life of the thermal head. Thermal paper ordinarily contains electrolytic material to prevent sheets from sticking to each other due to static electricity. If there is too much of this electrolytic material, high temperatures and humidity cause the material to ionise, resulting in electrolytic corrosion of the thermal head.

The PRN607-S turns the FET off and breaks the Vhead applied to the thermal head during waiting status to prevent electrolysis corrosion of the thermal head.

3 Specifications

Default settings

Interface	Serial RS232C, USB or IRDA		
	115.200 baud, 8 data bit, none parity, 1 stop bit, hardware		
Data format serial	handshake. Baud rate can be changed by software.		
	USB Printer class specification.

4 Function

4.1 General

Notice, when data is sent from the external equipment to the printer controller, all data has to be sent as binary file. If data is being sent as a character file, and some data in the file is equal to EOF, the rest will not be received.

4.2 Serial communication.

Standard communication is; Baud rate; 115.200 Baud Data bits = 8 Stop bits = 1. Parity = None Flow control = Hardware handshake

Baud rate can be changed. See setting for more information.

4.3 USB communication.

Build in USB interface is 100% compliant to USB 1.1 and fully approved by the USB organisation. For more details please contact I/F-COM. By plug USB cable - Host system will recognise I/F-COM interface board. Before connecting USB cable please set USB port as offline. Interface board will automatically online USB port. Data cannot be send from interface board to host. USB is not a bi-directional communication.

4.4 IRDA communication.

PRN607-S is prepared for IRDA via connector for IRDA transmission. Please contact I/F-COM for more information.

4.5 Firmware upgrade.

If firmware needs to be changed, alternative firmware can be downloaded. Please contact I/F-COM for firmware upgrade or changes.

The steps to download an alternative firmware in DOS are the following. These steps only work for a serial connection, look further down how to do it with USB.

- 1. Power the system off.
- 2. Disconnect printer.
- 3. Short circuit the pins "upgrade firmware"
- 4. Turn on printer
- 5. Write the following command "mode com1:9600,n,8,1", this command ensure that the serial port is at a known state.
- Write the following command "xmode 1 +", this command sets the baud rate to 115.200, the xmode program can be downloaded from the I/F-COM web site http://www.if-com.com/data/drivers/xmode.zip
- 7. Run the following command, "copy "filename" /b com1". The filename represents the path and the filename of the new firmware file. This file can be downloaded from website, or can be emailed by I/F-COM.

I/F-COM also offers a Windows utility program in order to download firmware through serial port. Visit <u>www.if-com.com</u> for more information.

For further information about downloading with the driver, can be found in the driver installation guide.

4.6 Auto form feed

When paper no paper is present, it is possible to form feed new paper automatic. While thermal head is down, place the paper at the roller. After 2 seconds (default) the paper will be pulled in automatically. Form feed wait time is 2 sec (default), but can be changed by a command.

4.7 Character design

The following figures describes the design of different types of characters (small):

4.7.1 Normal Character.

4.7.2 Low Character

4.7.3 Underline

When underline characters are printed the last line in the character matrix will be marked.

4.7.4 Bold

When bold characters are printed the character is or with itself shifted right.

28-03-2003 Page 4-18 of 53

4.7.5 Reverse

When reverse characters are printed the character matrix will be negated.

4.7.6 Italic.

When Italic characters are printed every line will be shifted the following number of dots to the right: (Line number from bottom)/4

4.7.7 Font sizes.

Font	Width	Height
Small	Normal	Normal
Low	Double	Normal
Narrow	Normal	Double
Normal	Double	Double
Wide	Double	Quadruple
High	Quadruple	Double
Large	Quadruple	Quadruple
Xlarge	Octuple	Octuple

When the size is normal or greater a build in smooth function will smooth the characters.

4.8 Printer commands

I/F-COM simple command set is default command set however optional command set can be downloaded. See appendix for additional information.

4.9 I/F-COM simple command set.

The following commands are use when communicating with the printer controller. All other commands is ignored

4.9.1 Small Font

[Name]	Small Font (8x12)
[Format]	ASCII	NUL
	Hex	00
	Decimal	0
[Description]	Chooses sm	all font from the current print position.

4.9.2 Low Font

[Name]	Low Font (1	6x12)
[Format]	ASCII	SOH
	Hex	01
	Decimal	1
[Description]	Chooses lov	v font from the current print position.

4.9.3 Narrow Font

[Name]	Narrow Font	t (8x28)
[Format]	ASCII	STX
	Hex	02
	Decimal	2
[Description]	Chooses na	rrow font from the current print position

4.9.4 Normal Font

[Name]	Normal Fon	t (16x28)
[Format]	ASCII	ETX
	Hex	03
	Decimal	3
[Description]	Chooses normal font from the current print position. The default font after power up or reset.	

28-03-2003 Page 4-20 of 53

I/F-COM

4.9.5	Wide Font	
	[Name] [Format]	Wide Font (32x28) ASCII EOT Hex 04 Decimal 4
	[Description]	Chooses wide font from the current print position.
4.9.6	High Font	
	[Name] [Format]	High Font (16x56) ASCII ENQ Hex 05 Decimal 5
	[Description]	Chooses high font from the current print position.
4.9.7	Large Font	
	[Name] [Format]	Large Font (32x56) ASCII ACK Hex 06 Decimal 6
	[Description]	Chooses large font from the current print position.
4.9.8	Xlarge Font	
	[Name] [Format]	Xlarge Font (64x112) ASCII BEL Hex 07
	[Description]	Chooses Xlarge font from the current print position.
4.9.9	Line Feed	
	[Name] [Format]	Line Feed ASCII LF Hex 0A
	[Description]	Decimal 10 When the printer controller receives this byte the text data in the buffer will be printed
4.9.10) Barcode on	
	[Name] [Format]	Barcode onASCIIVTHex0BDecimal11
	[Type] [Description] [Barcode char.	Barcode 39 Turns the barcode on until non-barcode character received.] Space , \$, % , * , + , - , . , / , 0-9 , A-Z

28-03-2003 Page 4-21 of 53

I/F

	[Notes]	The barcode 39 This character and the '*' can	9 must start and end with the character '*'. is the start and stop character in barcode 39, only be used as start and end character.
		If the barcode I barcode charac case the barco character will n	ength exceeds the paper size the last cter will not be written as barcode. In that de cannot be read because the last ot be '*'
4.9.11 Fee	ed Forward		
	[Name] [Format]	Feed Forward ASCII Hex	FF 0C
	[Description]	Decimal When this com whatever data	12 mand is received the printer will print it has in the buffer and feed forward 50mm
4.9.12 Re	verse off		
	[Name] [Format]	Reverse off ASCII Hex Decimal	SO 0E 14
	[Description]	This command	will switch off reverse printing
4.9.13 Re	verse on		
	[Name] [Format]	Reverse on ASCII Hex Decimal	SI 0F 15
	[Description]	This command	will switch on reverse printing
4.9.14 Un	derline off		
	[Name] [Format]	Underline off ASCII Hex Decimal	DLE 10 16
	[Description]	This command	will switch off underline printing
4.9.15 Un	derline on		
	[Name] [Format]	Underline on ASCII	DC1
	[. 0	Hex Decimal	11 17

[Description] This command will switch on underline printing

4.9.16 Bold off

[Name]	Bold off	
[Format]	ASCII	DC2
	Hex	12
	Decimal	18
[Description]	This comma	nd will switch off bold printing

4.9.17 Bold on

[Name]	Bold on	
[Format]	ASCII	DC3
	Hex	13
	Decimal	19
[Description]	This command	will switch on bold printing

4.9.18	Italic off	
[Name]	Italic off	
[Format]	ASCII	DC4
	Hex	14
	Decimal	20
[Description	on] This comm	and will switch off italic printing

4.9.19 Italic on

[Name] [Format]	Italic on ASCII Hex Decimal	NAK 15 21
[Description]	This command	will switch on italic printing
4.9.20 Initia	alise Printer	
[Name]	Initialise	
[Format]	ASCII	SYN
	Hex	16
	Decimal	22
[Description]	When the printer printer will be in even if buffer is	er controller receives this byte a reset of the nitialised. This command can be treated full.

28-03-2003 Page 4-23 of 53

4.9.21 Request Software version

[Name]	Request soft	ware version
[Format]	ASĊII	ETB
	Hex	17
	Decimal	23
[Description]	When the print version will be even if buffer	nter controller receives this byte the software e transmitted. This command can be treated is full.

4.9.22 Request Status

[Nan	ne]	Requ	uest status		
[Forr	mat]	ASC	11	CAN	
		Hex		18	
		Deci	mal	24	
[Des	cription]	Whe	n the printe	er controlle	r receives this byte a status byte
		will b	e transmitt	ed. This co	ommand can be treated even if
		buffe	er is full.		
		The	bit definitio	ns is as fol	lows
Bit	Status		0		1
0	Near end		Logic leve	l is low	Logic level is high
1	Paper		Present		Absent
2	Temperat	ure	Not too ho	ot	Head too hot to print
3	Head		Closed		Open
4	Paper Jar	n	No error		Error
5	Rxerror		No error		Rx error
6	Buffer		Not full.		Full (less than 16 bytes left)
7	Always 1.				

4.9.23 Request Analog voltage.

[Name]	Analog volta	ge		
[Format]	ASCII	EM		
	Hex	19		
	Decimal	25		
[Description]	When the pr	inter controller receives this byte the digital		
	value of the head voltage will be transmitted. This			
	command can be treated even if buffer is full			

4.9.24 Request Temperature

[Name]	Request Temp	erature	
[Format]	ASĆII	SUB	
	Hex	1A	
	Decimal	26	
[Description]	When the print	er controller receives this byte the digital	
	value of the head temperature will be transmitted. The		
	command can be treated even if buffer is full		

4.9.25 Sub command set

[Name]	Sub command set		
[Format]	ASCII	ESC	n
	Hex	1B	n
	Decimal	27	n
[Range]	n: [-128;127]		
[Description]	The n is the co	mmar	nds in the sub-set.

4.9.26 Upgrade command

[Name]	Upgrade	comm	hand
[Format]	ASCII	ESC	Z
	Hex	1B	5A
	Decimal	27	90
[Description]	Only used	d by tl	ne I/F-COM A/S upgrade programs.

4.9.27 Set auxiliary output

[Name]	Set auxilia	ary ou	tput		
[Format]	ASCII	ÉSC	p	n	
	Hex	1B	70	n	
	Decimal	27	112	n	
[Description]	When this	com	mand	is received then the	
	auxiliary o	output	can b	pe set.	
	If $n = 0$, the	en th	e out	put will be set to off	
	If n > 1 and < 254 then the output will be				
	turned on	in n/4	.096	msec, and then turned	
	off again.				
	lf n = 255,	then	the o	output will be turned on.	

28-03-2003 Page 4-25 of 53

4.9.28 Automatic sending status

	[Name] [Format] [Description]	Automatic sending status ASCII ESC a Hex 1B 61 Decimal 27 97 When this command is sent once, then the board will transmit the status every time that it change state.
4.9.29 Stop ser	nding automatic statu	S
	[Name] [Format]	Stop sending automatic status ASCII ESC b Hex 1B 62 Decimal 27 98
	[Description]	When this command is sent then it will turn off transmitting status.
4.9.30 Color/Gi	rey scale graphic	
	[Name] [Format]	Colour / Grey scale graphic ASCII ESC c n Hex 1B 63 n Decimal 27 99 n
	[Description]	When this command is sent then will the board not feed. After the next graphic data (both compression and not). The n is a percent of the burn ratio, n can be from 0 to 15, and the burn ratio is 100/15*n. This command is used by the driver to make colour and grey scales printout.
4.9.31 Enable s	saving data	
	[Name] [Format]	Enable saving data ASCII ESC d Hex 1B 64 Decimal 27 100
	[Description]	This command will enable that the boards save values to the flash, this is made to ensure that a wrong transmission not will change settings in the board, remember to send the command "Saving data to board", to actual save the data.

28-03-2003 Page 4-26 of 53

4.9.32 Save da	ta to board	
	[Name] [Format]	Save data to board ASCII ESC e Hex 1B 65 Decimal 27 101
	[Description]	This command saves all settings to flash.
4.9.33 Change	dot size	
	[Name] [Format]	Change dot size ASCII ESC f n Hex 1B 66 n Decimal 27 102 n
	[Description]	If $n = 0x01$, then the board is set to FTP607MCLXXX. If $n = 0x02$ then is it set to LTP. The value is saved to flash,
4.9.34 Change	form feed length	
	[Name] [Format]	Change form feed length ASCII ESC g n Hex 1B 67 n Decimal 27 103 n
	[Description]	N represents the value in mm that is form feeded after the feed command is sent. The value is saved to flash.
4.9.35 Change	baud rate	
	[Name] [Format]	Change baud rate ASCII ESC h n Hex 1B 68 n
	[Description]	Decimal 27 104 n N represents the new baud rate, legal values for n = 1 to 255. The baud rate is calculated as 921600/n = new baud rate. For instance 921600/8 = 115200baud. The value is saved to the flash
4.9.36 Change	form feed time	
	[Name] [Format]	Change form feed time ASCII ESC i n Hex 1B 69 n Decimal 27 105 n

28-03-2003 Page 4-27 of 53

[Description] N represents the time between that the board registry incoming paper, and to it starts feed the auto form feed length. The time is calculated as n * 50msec. The default setting is 2 seconds. The value is saved to flash. Legal values for n are between 1 and 255.

4.9.37 Feed Paper

[Name]	Feed Paper		
[Format]	ASCII	GS	n
	Hex	1D	n
	Decimal	29	n
[Range]	n: [-128;127]		
[Description]	When the prin paper will be f	ter co ed n-c	ntroller receives this command the lot lines. If the value is negative a
	reverse form f	eed w	ill be made.

4.9.38 Compensate Burn time

[Name]	Compensate burn time			
[Format]	ASCI	RS	n	
	Hex	1E	n	
	Decimal	30	n	
[Range]	n: [-15;15]			
[Description]	When the printe time will be com printout intensit send the printou	er con npens y will ut inte	atroller receives this command the burn sated. If a negative value is send the be lighter and if a positive value is ensity will be darker.	

4.9.39 Bar code width setting

[Name]	Bar code	width	settir	ng	
[Format]	ASCII		ESC	; e	m
	Hex	1B	65	m	
	Decimal	27	101	m	
[Range]	2<=m				
[Default]	m=6				
[Description]	Paramete	r n is	ignor	ed	

Parameter m is used to determine the dot width of the narrow and wide bar lines. The wide bar lines is equal to m dots and the narrow is equal to m/2 dots (rounded down).

28-03-2003 Page 4-28 of 53

4.9.40 Bar code height setting.

[Name]	Bar code	Bar code height setting				
[Format]	ASCII	EŠC	Ch	n		
	Hex	1B	68	n		
	Decimal	27	104	n		
[Range]	1<=n<=2	55				
[Default]	n=60					
[Description]	Paramete	er n sj	oecifie	es the height of a bar code in dots.		

4.9.41 Bar code printing

[Name]	Bar code	printir	ng			
[Format]	ASCII	ESC	k	m	n	d1 to dn
	Hex	1B	6B	m	n	d1 to dn
	Decimal	27	107	m	n	d1 to dn
[Description]	Paramete	r m sp	pecifi	es the	e type	of bar codes to be printed.

Parameter n specifies no of barcode characters.

m(dec)	Type of Barcode	Number of	Value of d
	Darcoue	characters	
65	UPCA	11<=n<=12	48<=d<=57
67	EAN13	12<=n<=13	48<=d<=57
68	EAN8	7<=n<=8	48<=d<=57
69	Code39	Variable	Space , \$, % , * , + , - , . , / , 0-9 , A- Z
72	Code128	Variable	0 to 105

UPCA: if n is 11 then the board calculate the checksum

EAN8: if n is 7 then the board calculate the checksum.

EAN13: if n is 12 then the board calculate the checksum

Code 39: The first and last character must be '*'. This is the syntax for Code 39.

Code128. There is three subset of Code128 (Code128A, Code128B and Code128C). The start character specifies which character set to be used. The start character must be either 103 (subset A), 104 (subset B), 105 (subset C).

The following table shows the value between data (d) and barcode.

Code128 barcode table

		_	•	<i>.</i>		_

4.9.42 Black Mark

[Name]	Set black mark parameters:
[Format]	ASCII RS n
	Hex 1E n
	Decimal 30 n
[Range]	n: [-15:15]
[Description]	When Black mark is enabled:
[Format]	ASCII ESC+205+3+97+m+n+o
[]	Hex 1B CD 03 61 m n o
	Decimal 27 205 3 97 m n o
[Range]	m = Page length 1 255
[italigo]	n = Paper offset 1 255
	o - Black mark length 1 255
[Description]	At printer stop on black mark the paper will be forwarded
[Description]	the full length of the black mark. Paper out is detected if full
	longth of the Black Mark is fooded and sensor does not
	detect naper
	detect paper.
	At no paper in printer and printing is requested form feed of
	black Mark Length will be executed. At no paper detected
	the printer will stop
	EE-0xC Eeed paper forward until next Black Mark or rest of
	nage whatever comes first
	page whatever comes hist.
	The following values can be set:
	The following values ban be set.
	PAGE LENGTH (default 150mm) This value is the paper
	length
	PAPER OFFSET (default 2mm) This value is the length
	between Black Mark and start of printing. Value must be
	between 2 mm, and Page length – 2mm
	BLACKMARK LENGTH (default 15mm) This is the length
	of the Black Marks
	The board can be set to transmit a 'B' whenever the paper
	is not detected at paper detect. This is typical when the
	sensor encounters a Black Mark
	The following commands is used for enabling Black Mark

28-03-2003 Page 4-31 of 53

Default:

PAGELENGHT=150mm PAPEROFFSET=2mm BLACKMARK=120 (120/8=15mm)

ESC+205+1+98+n

n: Bit 0: if set the board will transmit 'B' everytime paper is not detected at the paper detector. Bit 1: if set the Black Mark function is enable. Default n = 0.

4.9.43 Graphic data – non compressed

[Name]	Graphic data	– non-	compressed
[Format]	ASĊII	US	d1,d2,,dX
	Hex	1F	d1,d2,,dX
	Decimal	31	d1,d2,,dX
[Range]	n: [0;255]		
	X=54 for FTF	627MC	CLxxx, X=72 for FTP637MCLxxx,
[Description]	When the pringraphic bytes MSB in d1 is	nter co (d1-d) the left	ntroller receives this command the X () will be printed in one dot line. The most dot and the LSB in dX is the right

4.9.44 Graphic data - compressed

[Name]	Graphic data –	com	pressed
[Format]	ASCII	Y	d1,d2,,d(-Y)
	Hex	Y	d1,d2,,d(-Y)
	Decimal	Y	d1,d2,,d(-Y)
[Range]	Y: [-X;-2]		
	N: [U;255]	27140	Novy V-72 for ETD627MCL vvv
[Description]	When the printe (Decimal 256-Y data. The number negative value.	er co / to 2 ber o	ntroller receives a byte that is –Y to –2 54) the following data is compressed f compressed graphic bytes is the
	This means: If Y = -10 (Deci data.	imal 2	246) the next 10 bytes is compressed
	The compresse When a data by received is the send as non co	ed da yte is numl ompre	ta is as follows. 0 (no dots activated) the next byte ber of bytes that are 0. All other data is essed.
			_

A very few lines cannot be compressed. These will if you try to compress them be longer than the non-compressed line. These must therefore be send as non-compressed data.

5 Maintenance

5.1 Daily use

Printer and interface board must be switch off while in idle mode.

5.2 Store/Transport

The product has to be stored under ESD safe conditions, and to be packed safely during transportation.

28-03-2003 Page 5-34 of 53

6 Specifications

6.1 Electrical Data

Voltage: 18-26VDC

Current: Maximum head current:<u>Numbers of active dots * Vhead</u> 1.500+/-15%

Maximum motor current: 1.000mA

Power up sequence:max. 10 msec. 10 - 90% Voltage appliedPower down sequence:max. 10 msec. 90 - 10% Voltage applied

6.2 Mechanical Data

Dimensions: Length, width, height: 77 mm* 50 mm * max. 15 mm Including connectors. Vibration: 100G XYZ Shock: 100G XYZ

6.3 Environmental Data

Operation:	Temperature: -20°C- +85°C
-	Humidity : 10%-99% RH, without condensing
Storage:	Temperature: -40°C - +85°C
	Humidity: 0%-99% RH, without condensing
Transport:	Temperature: -40°C - +85°C
-	Humidity: 0%-99% RH, without condensing

6.4 EMC & ESC

The printer controller is tested acco	ording to:
Emission: E-Field:	EN50081-1-1
Conducted:	EN50081-1-2
Immunity: E-field:	EN50082-1-1
Conducted transients:	EN50082-1-2
Over voltage:	EN50082-1-3
Medical equipment:	IEC601-1-2

ESD: 4 kV contact discharge against parts exposed to contact at normal use; 8 kV air discharge.

28-03-2003 Page 6-35 of 53

6.5 Temperature Test

Temperature shock: (no voltage applied) -28°C to +100°C at 1 sec. 100 times: no damage.

28-03-2003 Page 6-36 of 53

	excitation

7.3 Command list description

Each command is explained using the following conventions:

[Name]	Command name
[Function]	Function of command
[Code] notation.	Control code represented in hexadecimal or decimal
	[X] ₁₆ Hexadecimal notation [X] ₁₀ Decimal notation
[Explanation]	Explanation of command function
in a set a lita h	

7.3.1 Horizontal tab

[Name]

Horizontal tab

28-03-2003 Page 7-44 of 53

[Function]

The HT command moves the printing position to the tab position. [Code] $\begin{bmatrix} 09 \end{bmatrix}_{16} \\ \begin{bmatrix} 09 \end{bmatrix}_{10} \end{bmatrix}$

[Explanation]

- 1. If the next horizontal tab position is not set, the HT command is ignored.
- 2. If the next horizontal tab position is outside the printing area, the printing position is shifted to the proper position by adding 1 to the printing area width.
- 3. If an HT command is received when the print head is located at the position to which the printing has been newly shifted by adding 1 to the printing area width, buffer-full printing is executed. Then, the horizontal tab operation is executed from the head of the next line.
- 4. The horizontal tab position is set with ESC D.
- 5. If characters are received when the print head is located at the position to which the printing has been shifted by adding 1 to the printing area width, buffer-full printing is executed. Then, the print head moves to the leftmost column on the next line, and the received characters are processed. When a line feed command such as *LF* is received, data is printed and a line is fed. The print head then moves to the leftmost column on the next line.
- 6. In backward printing, the tab indicates a position from the rightmost column.
- 7.

7.3.2 Line feed

[Name] Line feed [Function] The LF command prints the data already contained in the print buffer, then sets the next-data receive position at the leftmost column on the next line. [Code] $[0A]_{16}$ $[10]_{10}$

[Explanation]

- 1. The *LF* command prints the data already contained in the print buffer, then sets the next-data receive position at the leftmost column on the next line.
- 2. In the initial state, the line spacing is set to approx. 1/8 inch.
- 3. When there is no data in the print buffer, only a line feed operation is executed.
- 4. When different-height character typefaces are to be printed on the same line, these character typefaces are arranged so that their bottom ends are aligned at the same level.

5. If line spacing during printing/line-feeding is shorter than the character height, a length equal to the character height feeds the paper.

7.3.3 Forms feed

[Name] Forms feed (new page) [Function]

The FF command prints the data already contained in the print buffer, then sets the next-data receive position at the leftmost column on the next page. $[OC]_{16}$

[0C]₁₆ [12]₁₀

[Explanation]

(1) The FF command feeds paper by the specified page length.

(2) In the initial state, the page length is set to approx. 143 mm. (44 lines).(3) When cut-sheet printing is selected, the *FF* command executes the following operations:

- 1. When the page length is set to 0 (page length cancellation) by using
- 2. ESC C, the paper is ejected.
- 3. Paper ejection is checked using the paper-out sensor. When the detection is invalid, the paper ejection is checked.
- 4. The maximum paper ejection length is approx. 1m. If the paper-out state is not detected within the span of the 1-meter ejection, the paper ejection terminates.
- 5. When paper with mark is selected, the *FF* command executes the following operations:
- 6. The data contained in the print buffer is printed, and a search is made for the head of the next label.
- 7. The beginning of a line is set as the next printing position.
- 8. A paper with mark is selected with ESC c1.

7.4 APS compatible command set

7.4.1 Escape sequences, overview.

GS/n	Set printing speed / Maximum peak current
GS D n	Set print Intensity
ESC v	Send printer status
ESC I	Send printer identity
ESC @	Resets printer
ESC S	Puts the printer in sleep mode
GS B n	Serial Communication setting
GSbn	Set parallel port Busy line hold time
ESC % n	Select internal Character Set
ESC R n	Select international character Set
ESC 3 n	Set line spacing
ESC SP n	Set character spacing
ESC ! n	Set print mode
ESC { n	Set/reset Rotated character
LF	Line feed
CR	Carriage return
ESC J n	Feed paper (n dot lines) forward
ESC j n	Feed paper (n dot lines) backward
CAN	Cancel print data buffer (text mode)
ESC * n1 n2 n3 n4 n5 n6, data	Print graphics
ESC \$ n1,n2	Horizontal dot positioning
ESC V n1,n2,n3 data	Horizontal bit image
ESC m	Partial cut
ESC i	Full cut
GS k n [Start] <data> NUL</data>	Print bar code
GShn	Barcode Height
GS w n	Barcode magnification
GSHn	Text position in Barcode
GSLn	Set Mark length
GS T n Se	Set TOF position
GS E	TOF feed paper
GS X n1 n2	Set Mark to Cut Position
GS x n1 n2	Set Cut Line to Head Dot line Length

GS / n Description:

Format:

Set printing speed / Maximum peak current/ Dynamic division <1Dh> <2Fh> <n>

28-03-2003 Page 7-47 of 53

Comments:	n=1 to 32: (Default n=5) Software programmable consumption (Dynamic division). The maximum number of black dots which are simultaneously heated is $(n+1) \ge 8$. In Default Mode, n = 5
Example:	n=5 Maximum black dots heated: $(5+1)^*8=48$. Printer Peak consumption @5V: $(0.3A (Stepper Motor) + 5^*48/160) = 1.8A$ 160 Ohms is the dot resistance.
GS D n	
Description:	Set print Intensity
Format:	<1Dh> <44h> <n></n>
Comments:	n=8Fh (127d) : (Default). Nominal print intensity n>8Fh (127d) : Printout becomes darker n<8Fh (127d) : Printout becomes lighter (n from 0 to 255 (FFh)).
ESC v	
Description: Format: Comments:	Send printer status <1Bh> <76h> The printer returns a single byte that reflects the status of the printer in accordance with the following table:

28-03-2003 Page 7-48 of 53

7.5 ESC/POS compatible command set

7.6 Escape sequences, overview.

ESC c 4	Select Paper Near End Sensors to stop printing
HT	Horizontal Tab
LF	Print and Line feed
FF	Print and return to standard Mode
CR	Print and carriage return
DLE EOT n	Real Time status transmission
DLE ENQ n	Real time request to printer
CAN	Cancel print data in page mode
ESC FF	Print data in page mode
ESC SP n	Set right side character spacing
ESC ! n	Select print mode(s)
ESC\$ nL nH	Set absolute print position
ESC % n	Select /cancel user-defined character set
ESC & y c1 c2 [x1	
d1dy * x1][xk	Define user defined characters
d1dy * xk]	
ESC * m nL n H [d]k	Select bit image mode
ESC - n	Turn underline mode on/off
ESC 2	Select 1/6-inch spacing
ESC 3 n	Set line spacing
ESC = n	Set peripheral device
ESC ? n	Cancel user defined characters
ESC @	Initialize printer
ESC [n] k NUL	Set horizontal tab position
ESC E n	Turn emphasized mode on/off
ESC G n	Turn on/off double strike mode
ESC J n	Print and feed paper
ESC L	Select page mode
ESC R n	Select an international character set
ESC S	Select standard mode
ESC T n	Select print direction in page mode
ESV V n	Turn 90° clockwise rotation mode on/off
ESC W xL xH yL yH	Set printing in page mode
dxH dyL dyH	Set printing in page mode
ESC c 5 n	Enable/Disable panel buttons
ESC c 3 n	Select paper near end sensors to output end signals
ESC a n	
	Select justification
ESC \ nL nH	Select justification Set relative print position

28-03-2003 Page 7-49 of 53

ESC i	Partial cut
ESC p m t1 t2	Cash drawer Output
ESC t n	Select character Code table
ESC u n	Transmit peripheral device status
ESC v	Transmit paper sensor status
ESC { n	Turns on/off upside-down printing mode
GS!n	Select character size
G S \$ nL nH	Set absolute vertical print position in page mode
GS * x y [d] x*y *8	Define download bit image
GS/m	Print downloaded bit image
GS :	Start / end macro definition
GS B n	Turn white/black reverse printing mode
GSHn	Select printing position for HRI characters
GSIn	Transmit printer ID
GS L nL nH	Set left margin
GS P x y	Set horizontal and vertical motion units
GSVmn	Select cut mode and cut paper
GS W nL nH	Set printing area width
GS \ nL nH	Set relative vertical print position page mode
GS^rtm	Execute macro
GS a n	Enable /Disable Automatic Status back
GSbn	Turns smoothing mode on/off
GSfn	Select font for Human Readable Interpretation (HRI)
	chararacters
GShn	Select bar code height
GS k m d1dk NUL	Print bar code
GS k m n d1dn	Print bar code
GSrn	Transmit status
GS w n	Set bar code width

MAN607-S
