

SERVICE MANUAL

VHF FM REPEATER

IC-FR3000

IC-FR3100

INTRODUCTION

This service manual describes the latest service information for the **IC-FR3000/IC-FR3100** VHF FM REPEATER.

Model	Version	Symbol	Frequency range	AC supply	Power
IC-FR3000	U.S.A.	USA	150 –174 [MHz]	100 –120 [V]	50 [W]
	General	GEN2		148 –172 [MHz]	220 –240 [V]
		GEN74			
IC-FR3100	Europe	EUR2	150 –174 [MHz]	220 –240 [V]	25 [W]
Germany	FRG2				

To upgrade quality, all electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

DANGER

USE ONLY the specified AC voltage described on the AC power socket. Other voltages may causes repeater damage or personal injury.

DO NOT expose the repeater to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the repeater.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the repeater's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1110003780 S.IC NJM2902V IC-FR3000 LOGIC UNIT 1 piece
8930056450 2368 6-key IC-FR3000 CHASSIS 5 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the repeater.
2. **DO NOT** open the repeater until the repeater is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the repeater is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB or 50 dB attenuator between the repeater and a deviation meter or spectrum analyser when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the repeater.

SECTION 1 SPECIFICATIONS

		IC-FR3000	IC-FR3100	
GENERAL	Measurement method	EIA / TIA-603	ETS 300 086	
	Frequency range	[USA2], [GEN2], [GEN4], [GEN74], [EUR2], [FRG2]: 150.000–174.000 MHz [GEN74]: 148.000–172.000 MHz		
	Type of emission	Wide (25 kHz): 16K0F3E Middle (20 kHz): 14K0F3E Narrow (12.5 kHz): 8K50F3E		
	Channel spacing	[USA2], [GEN2], [GEN4], [GEN74], [EUR2]: 25/12.5 kHz [FRG2]: 20/12.5 kHz		
	Frequency stability	±2.5 ppm	±1.0 kHz	
	Number of channels	Max. 32 channel		
	Antenna connector	Type-N × 2 (50 Ω)		
	Power supply requirement	AC	[USA2], [GEN2]: 100–120 V [GEN4], [GEN74], [EUR2], [FRG2]: 220–240 V	
		DC	13.6 V DC (negative ground)	13.2 V DC (negative ground)
	Current drain (approx.)	TX	TX (at 50 W) 15.0 A	TX (at 25 W) 10.0 A
		RX	RX (max. audio) 2 A (stand-by) 1 A	
	Operating temperature range	–30°C to +60°C (–22°F to +140°F)		–25°C to +55°C
	Dimensions (proj. not included)	410(W) × 110(H) × 360(D) mm; 16.1 (W) × 4.3 (H) × 14.1 (D) inch		
Weight (approx.)	12 kg; 26.5 lb			
TRANSMITTER	RF output power (High/Low)	50/10 W	25/5 W	
	Modulation system	Variable reactance frequency modulation		
	Maximum frequency deviation	[Wide]: ±5.0 kHz, [Middle]: ±4.0 kHz, [Narrow]: ±2.5 kHz		
	Spurious emissions	70 dBc typical	0.25 μW ≤ 1GHz, 1.0 μW > 1 GHz	
	Adjacent channel power	[Wide], [Middle]: 70 dB, [Narrow]: 60 dB		
	Input impedance	600 Ω		
RECEIVER	Receive system	Double-conversion superheterodyne system		
	Intermediate frequencies	1st: 31.65 MHz, 2nd: 455 kHz		
	Sensitivity (typical)	0.5 μV at 12 dB SINAD	6 dBμV (emf) at 20 dB SINAD	
	Adjacent channel selectivity (typical)	[Wide], [Middle]: 70 dB, [Narrow]: 60 dB		
	Spurious response	70 dB		
	Intermodulation (typical)	70 dB		
	Audio output power	2.5 W typical at 10% distortion with a 4 Ω load		
	Audio output impedance	4 Ω		

All stated specifications are subject to change without notice or obligation.

SECTION 3 CIRCUIT DESCRIPTION

3-1 RECEIVER CIRCUITS

3-1-1 RF CIRCUIT (RX UNIT)

Received signals from the RX antenna connector enter the RX unit J1 and pass through a tuned bandpass filter (D3, D4, L2, L3, C5–C8, C12, C13, C205, C206, C220, 221) which is controlled by the D/A converter IC (LOGIC unit; IC25). The filtered signals are applied to an RF amplifier (Q1). The amplified signals are applied to a bandpass filter (L6, L7, L12, L13, C9–C11, C14, C15, C21, C22, C24, C30, C207, C208), and are then applied to the 1st mixer circuit.

3-1-2 1ST MIXER AND 1ST IF CIRCUITS (RX UNIT)

The 1st mixer circuit converts the received signals to a fixed frequency of the 1st IF signal with the PLL output frequency. By changing the PLL frequency, only the desired frequency will pass through a crystal filter at the next stage of the 1st mixer.

The filtered signals are applied to the 1st mixer circuit (L8, L9, L10, IC1) and are then mixed with the 1st LO signal from the PLL circuit to produce a 31.65 MHz 1st IF signal.

The 1st IF signal passes through a MCF (Monolithic Crystal Filter; F11) to suppress out-of-band signals. The filtered signal is applied to the 2nd mixer circuit (IC2, pin 16) via the buffer amplifier (Q3).

3-1-3 2ND IF AND DEMODULATOR CIRCUITS (RX UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double-conversion superheterodyne system improves the image rejection ratio and obtains stable receiver gain.

The amplified signal is applied to the 2nd mixer section of the FM IF IC (IC2, pin 16), and is then mixed with the 2nd LO signal for conversion to a 455 kHz 2nd IF signal.

IC2 contains the 2nd mixer, limiter amplifier, quadrature detector, active filter and noise amplifier circuits, etc. The

local oscillator section and X2 generate 31.195 MHz for the 2nd LO signal.

The 455 kHz 2nd IF signal is applied to a ceramic bandpass filter (narrow; F15, wide; F16) where unwanted signals are suppressed and are then applied to a limiter amplifier section in the system IC (IC2, pin 5).

The 2nd LO signal is then amplified at the limiter amplifier section (IC2, pin 5) and applied to the quadrature detector section (IC2, pins 10, 11 and X1) to demodulate the 2nd IF signal into AF signals.

The AF signals are output from pin 9 (IC2) and are then applied to the AF amplifier circuit on the LOGIC unit.

3-1-5 AF AMPLIFIER CIRCUIT (LOGIC UNIT)

The AF amplifier circuit amplifies the demodulated AF signals to drive a speaker.

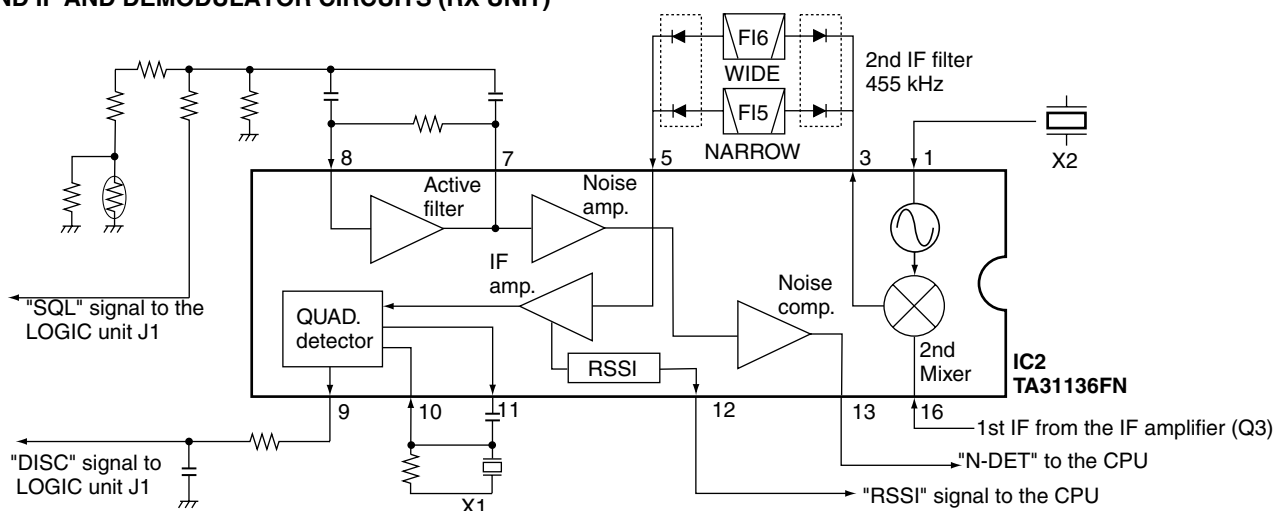

The AF signals from the FM IF IC (RX unit; IC2, pin 9) are applied to a buffer amplifier (IC9, pins 8, 9). The amplified signals pass through the high-pass filter (IC9, pins 5, 7, 12, 14) which removes CTCSS or DTCS signals.

The filtered AF signals are output from pin 7 (IC9), and are applied to the de-emphasis circuit (IC9, pins 1, 2) with frequency characteristics of -6 dB/octave, and then passed through a low-pass filter (IC10, pins 1, 3, 5, 7). The filtered signal is applied to a volume control (VR unit; R1) to control the audio level.

IC2 contains the 2nd mixer, limiter amplifier, quadrature detector, active filter and noise amplifier circuits, etc. The local oscillator section and X2 generate 31.195 MHz for the 2nd LO signal.

The output AF signals from a volume control (VR unit; R1) pass through the analog switch IC (IC16, pins 1, 7), and are then applied to the AF power amplifier (IC17, pins 1, 4) to drive a speaker.

• 2ND IF AND DEMODULATOR CIRCUITS (RX UNIT)

3-1-6 RECEIVER MUTE CIRCUITS (LOGIC UNIT)

• NOISE SQUELCH

The noise squelch circuit cuts out AF signals when no RF signals are received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switch.

Some noise components in the AF signals from the FM IF IC (RX unit; IC2, pin 9) are passed through the SQL level controller (VR unit; R2). The level controlled signals are applied to the active filter section in the FM IF IC (RX unit; IC2, pin 8). Noise components about 10 kHz are amplified and output from pin 7 (RX unit; IC2).

The filtered signals are converted to the pulse-type signals at the noise detector section and output from pin 13 (RX unit; IC2).

The NDET signal from the FM IF IC (RX unit; IC2) is applied to the CPU (IC33, pin 40). The CPU analyses the noise condition and controls the AF mute signal via "AFMUTE1" line (IC40, pin 4) to the AF mute switch (IC16, pin 5).

• TONE SIGNALS

The tone squelch circuit detects AF signals and opens the squelch only when receiving a signal containing a matching subaudible tone (CTCSS or DTCS).

The CTCSS signal passes through a low-pass filter circuit (IC8, pins 1, 3, 5, 7, 8, 10), and is then applied to the signal amplifier (IC8, pins 13, 14). The amplified signal is applied to the CTCSS decoder IC (IC29, pin 16) and the detected sig-

nal is applied to the CPU (IC 33) via the serial signal line.

The DTCS signal passes through a low-pass filter circuit (IC12, pins 1, 3, 8, 10), and is then applied to the signal amplifier (IC12, pins 12, 14). The amplified signal is applied to the DTCS decoder which is inside the CPU (IC33, pin 52) via the "DTCSI" line.

The 2/5TONE signals are passes through a low-pass filter circuit (IC12, pins 5, 7), and are then applied to the 2/5 TONE decoder which is inside the CPU (IC33, pin 51) via "25TI" line.

The DTMF signal is pass through the DTMF switch IC (IC30 pin 7), and is then applied to the DTMF decoder (IC31). The decoded signal is applied to the CPU (IC33, pins 82, 85, 86). The CPU analyzes the DTMF signal.

The DTMF switch (IC30) selects the signal from telephone line or RX unit.

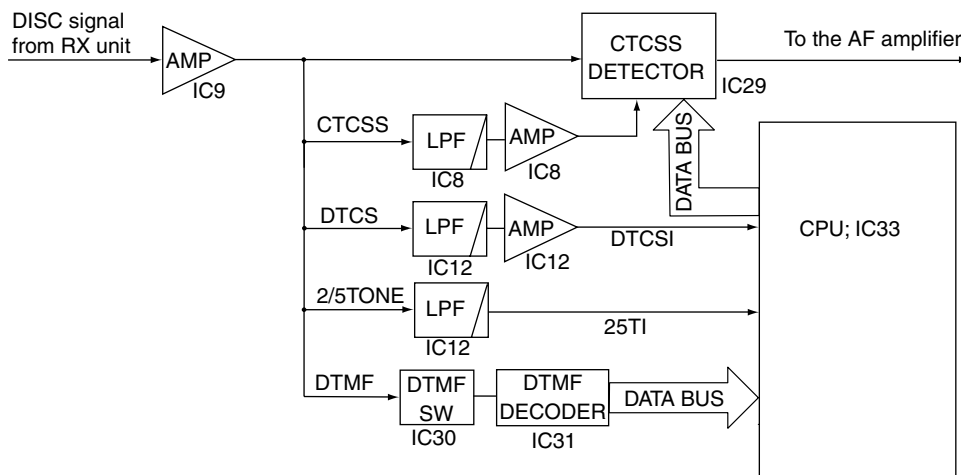

3-2 TRANSMITTER CIRCUITS

3-2-1 AF AMPLIFIER CIRCUIT (LOGIC UNIT)

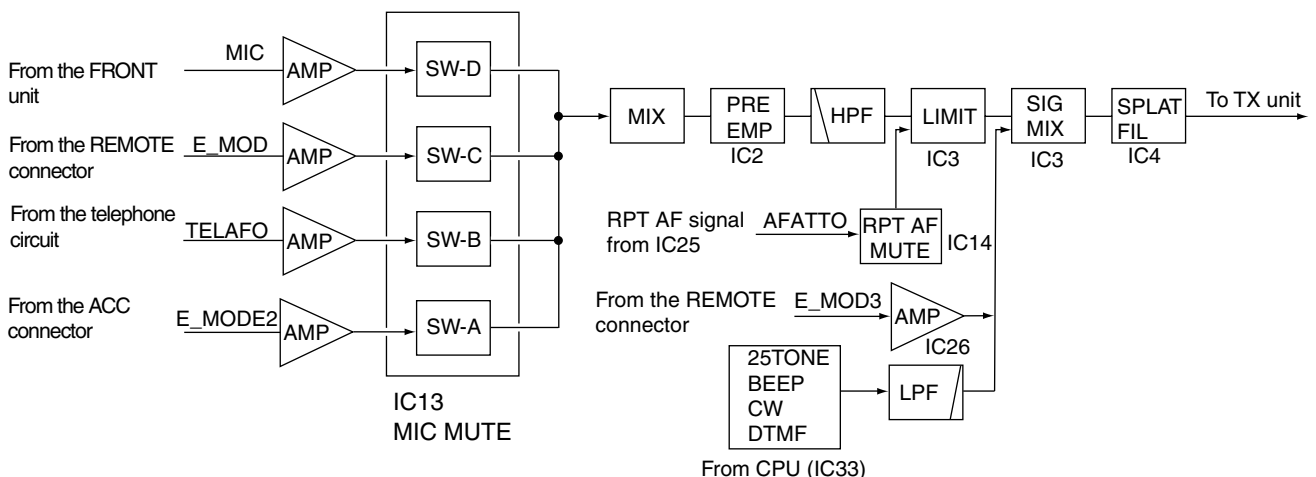

• IN CASE OF THE AF SIGNALS FROM THE MIC JACK

The AF signals from the MIC jack (FRONT unit; J7) are amplified at the AF amplifier (IC1). The amplified signals are mixed with the "E_MOD1", "E_MOD2" and "TELAFO" signals at IC2. The mixed signals pass through the high-pass filter (IC2, pins 1, 2, 6, 7) via the pre-emphasis circuit (IC2, pins 8, 9).

• TONE SIGNALS CIRCUITS (LOGIC UNIT)

• AF AMPLIFIER CIRCUITS (LOGIC UNIT)

The filtered signals are applied to the limiter amplifier (IC3), and are then mixed with the DTMF signal from the CPU (IC33, pin 43) via the TX-signal filter (IC3, pins 8, 10, 12, 14). The mixed signals are applied to the splatter filter (IC4), and are then applied to the PA unit.

• IN CASE OF THE AF SIGNALS FROM THE ANTENNA CONNECTOR

The AF signals (received signals) from the antenna connector (RX unit; J1) are applied to the buffer amplifier (IC9), CTCSS detector (IC29) and AF amplifier (IC6). The amplified signals are applied to the D/A converter IC (IC25, pins 8, 9) to adjust a repeater AF level. The adjusted AF signals pass through the RPT AF mute switch (IC14), and are applied to the limiter amplifier (IC3).

• IN CASE OF THE 2/5TONE SIGNALS

The 2/5TONE signals from the CPU (IC33, pin 43) are applied to the mixer amplifier (IC3) via TX signal filter circuit (IC3, pins 8, 10, 12, 14).

• IN CASE OF THE DTMF SIGNALS FROM DIALER IC

The DTMF from dialer IC (IC47, pin 14) are applied to the mixer amplifier (IC3) via the TX signal filter circuit (IC3, pins 8, 10, 12, 14).

• IN CASE OF THE CTCSS AND DTCS SIGNALS FROM THE CPU

The CTCSS and DTCS signals from the CPU (IC33, pin 44) are applied to the TX-tone filter (IC4, pins 12, 14). The filtered signal are applied to the D/A converter IC (TX unit; IC5 pin 9) to adjust a tone level needed, and are then mixed with AF signal at the mixer amplifier IC (TX unit; IC6).

3-2-2 MODULATION CIRCUIT (TX UNIT)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the AF audio signals.

The filtered signals from the LOGIC unit are applied to the D/A converter (IC5, pin 4) to adjust AF level. The adjusted signals are applied to the mixer amplifier IC (IC6, pin 1) with the CTCSS/DTCS signals.

The mixed signals are applied to the TX VCO circuit to mod-

ulate the oscillated signal (TVCO unit; D5) and modulate the oscillated signal at VCO circuit (TVCO; Q1, D1–D4). The modulated VCO output is amplified at the buffer amplifier (Q1) and is then applied to the drive amplifier circuit on the PA unit.

3-2-3 POWER AMPLIFIER CIRCUIT (PA UNIT)

The power amplifier circuit amplifies the driver signal to an output power level.

The RF signal from the TX unit is applied to the pre-drive (Q4) to amplify the level needed at the power amplifier. The amplified signal passes through the attenuator circuit (R29–R31) and is then applied to the power amplifier (IC2).

The RF signal from the pre-drive (Q4) is applied to the power amplifier (IC2) to obtain 50 W ([IC-FR3100]: 25 W) of RF power.

The amplified signal is passed through a low-pass filter circuit (L6, L7, L20, C1–C3, C48, C73, C98, C100) and APC detector (D2, D4, R7, R8, R20, R21, R25, R26, 58, R36, R37, C78, C79), and is then applied to the TX antenna connector (CHASSIS; J1).

Control voltage for the pre-drive (Q4) and power amplifier (IC2) comes from the APC amplifier (IC1, Q9, Q10) to obtain stable output power. The transmit mute switch (Q7, Q8) controls the pre-drive (Q4) and power amplifier (IC2) when transmit mute is necessary.

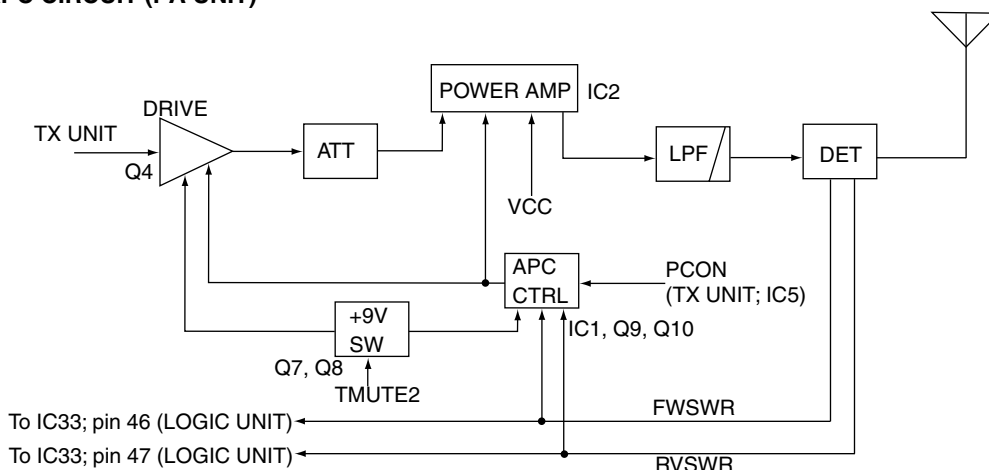

3-2-4 APC CIRCUIT (PA UNIT)

The APC circuit protects the power amplifier from a mismatched output load and stabilizes the output power.

The APC detector circuit detects forward signals and reflection signals at D2 and D4 respectively. The combined voltage become minimum level when the antenna impedance is matched at 50 Ω, and the voltage is increased when it is mismatched.

The detected voltage is applied to the APC amplifier (IC1 pin 3), and the power setting “PCON” signal from the D/A converter (TX unit; IC5), controlled by the CPU (LOGIC unit; IC33), is applied to the APC amplifier (IC1 pin 1) for reference. When antenna impedance is mismatched, the

• APC CIRCUIT (PA UNIT)

detected voltage exceeds the power setting voltage. Then the output voltage of the APC amplifier IC (IC1, pin 4) controls the input current of the drive amplifier (Q4) and power amplifier IC (IC2, pin 2) to reduce the output power.

3-3 PLL CIRCUITS

3-3-1 GENERAL

Each receiver and transmitter circuit has an independent PLL circuit for controlling frequencies. All PLL circuits are shielded and installed on the RX and TX units.

PLL circuits steadily oscillate the transmit frequency and the receive local frequency. The PLL output frequency is controlled by divided ratio (N-data) of the programmable divider.

3-3-2 RECEIVER PLL CIRCUIT (RX UNIT)

The PLL IC (IC4) which includes in the prescaler, the programmable counter and the phase comparator generates the 1st LO frequency with the VCO circuit (RVCO unit; Q1, D1–D4). The PLL IC sets the divided ratio which bases on N-data from the CPU (LOGIC unit; IC33) to control the programmable counter. The PLL IC compares a phases of the VCO signal with the reference oscillator frequency, and is then applied to the VCO circuit (RVCO unit; Q1, D1–D4).

3-3-3 RECEIVER REFERENCE OSCILLATOR CIRCUIT (RX UNIT)

The 12.8 MHz reference frequency is produced by the oscillator (X3). The frequency is adjusted by the D/A converter IC (LOGIC unit; IC25). The reference frequency is applied to the PLL IC (IC4, pin 1).

3-3-4 RECEIVER VCO CIRCUIT (RVCO UNIT)

The VCO circuit (Q1, D1–D4) generates the receive frequency. The signal is applied to the buffer amplifier (Q2) and is then applied to the PLL IC (RX unit; IC4). The signal is amplified at the amplifiers (RX unit; Q8, Q9) and then passes through the low-pass filter (RX unit; L23, L24, L39, L53, C112–C114, C184, C216, C217) and attenuator (RX unit;

R81, R136, R137). The filtered signal is applied to the 1st mixer circuit (RX unit; IC1) as 1st LO signal.

A part of the signal is applied to the PLL IC (RX unit; IC4) via the amplifier (RX unit; Q14) as RX PLL lock voltage.

3-3-5 TRANSMITTER PLL CIRCUIT (TX UNIT)

The PLL IC (IC2) which includes in the prescaler, the programmable counter and the phase comparator. The PLL IC sets the divided ratio which bases on N-data from the CPU (LOGIC unit; IC33) to control the programmable counter. The PLL IC compares a phases of the VCO signal with the reference oscillator frequency, and is then applied to the VCO circuit (TVCO unit; Q1, D1–D4).

3-3-6 TRANSMITTER REFERENCE OSCILLATOR CIRCUIT (TX UNIT)

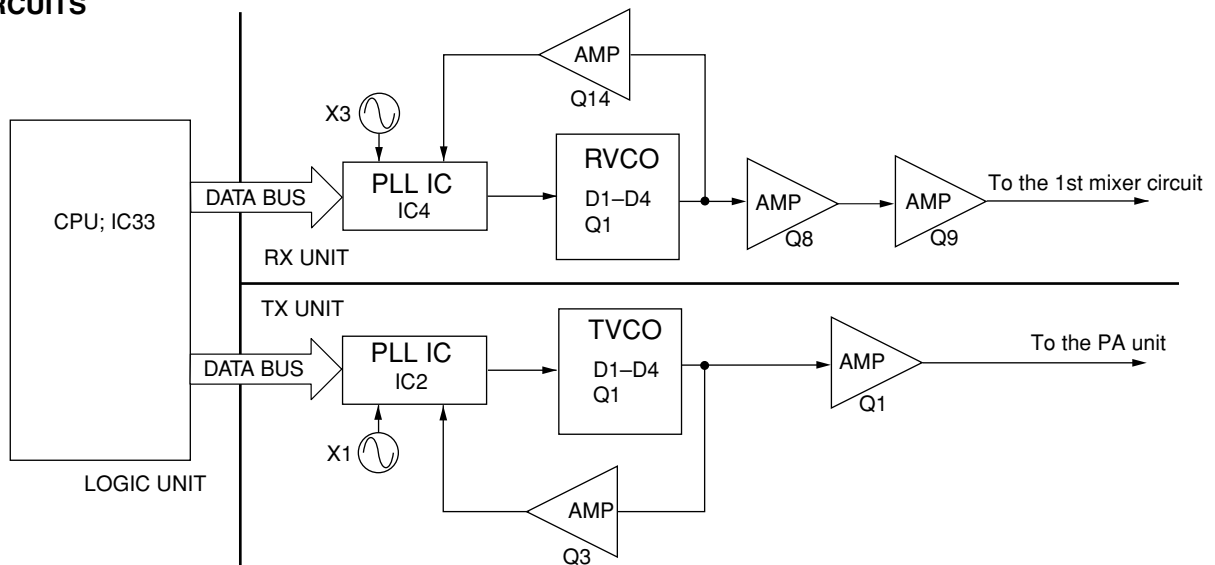

The 12.8 MHz reference frequency is produced by the oscillator (X1). The frequency is adjusted by the D/A converter IC (IC5, pin 14). The reference frequency is applied to the PLL IC (IC2, pin 1).

3-3-7 TRANSMITTER VCO CIRCUIT (TVCO UNIT)

The VCO circuit (Q1, D1–D4) generates the transmit frequency. The signal is applied to the buffer amplifier (Q2) and is then applied to the amplifier (TX unit; Q1). The amplified signal is applied to the PA unit.

A part of the signal is applied to the PLL IC (TX unit; IC2) via the amplifier (TX unit; Q3) as TX PLL lock voltage.

• PLL CIRCUITS

3-4 OTHER CIRCUITS

3-4-1 TELEPHONE IF CIRCUIT (LOGIC UNIT)

The signals from the telephone line (FRONT, J13) are applied to the ringer detect circuit (IC48, D1, D5, R131, R143, R145, C100, C103, C375). The detected signals are applied to the CPU (IC33, pin 73) via "RING" line. The "HOOKC" signal from the CPU (IC33, pin 72) and the "DP" signal from IC47 are applied to the hook switch (RL1, RL2) to off-hook.

Received AF signals from the RX unit pass through the high-pass filter (IC9, pins 5, 7, 12, 14), de-emphasis (IC9, pins 1, 2) and low-pass filter circuits (IC10, pins 1, 3, 5, 7, 8, 9). The filtered AF signals are amplified at IC7 (pins 12, 14) and are then applied to the network IC (IC46, pin 16) via T6. The output signals from IC46 are applied to the J13 (FRONT unit) via L1, L2.

AF signals from J13 (FRONT unit) are applied to the network IC (IC46, pins 8, 9). The output signals from IC46 (pins 8, 9) are applied to the AF amplifier IC (IC1, pins 1, 2) via T8. Amplified signals pass through the MIC mute switch (IC1, pins 3, 4), the MIC mixer amplifier (IC2, pins 13, 14), the pre-emphasis circuit (IC2, pins 8, 9), the high-pass filter circuit (IC2, pins 1, 2, 6, 7), limiter amplifier circuit (IC3, pins 1, 2), S-mixer circuit (IC3, pins 6, 7), and splatter filter circuit (IC4, pins 1, 3, 5, 7, 8, 10). The filtered signals are applied to the TX unit.

After off-hook condition, DTMF signal from telephone line is applied to the decoder IC (IC31) to decode the DTMF signal. The DTMF signal is applied to the CPU (IC33) via serial signal line.

The clear down signal is detected at IC45 and is then applied to the CPU (IC33). The "HOOKC" signal from the CPU (IC33, pin 72) and the "DP" signal from IC47 are applied to the hook switch (RL1, RL2) to on-hook.

3-4-2 EEPROM CIRCUIT (LOGIC UNIT)

The detector IC (IC34) detects power supply ON-OFF voltage. The signal from IC34 is applied to IC33 (CPU). IC35, IC36 are reset signal circuit which stabilizes memory data for the EEPROM (IC37).

EEPROM (IC37) memories clone data and adjust setting condition data.

3-4-3 TEMPERATURE DETECT CIRCUIT (LOGIC UNIT)

The temperature detect circuit protects the power amplifier and power supply circuit from high temperature and stabilizes the output power.

Inside temperature of the PA unit is detected at D15 (PA unit) and is then applied to the amplifier IC (PA unit; IC3). The amplified signal is applied to the CPU (IC33) to analyze the temperature via IC32.

Inside temperature of the REG unit is detected at D6 (REG unit) and is then applied to the amplifier (REG unit; IC9). The amplified signal applied to the CPU (IC33) to analyze the temperature via IC32.

IC32 selects "PATEMP" or "REGTEMP" signals from the PA or REG unit.

3-5 POWER SUPPLY CIRCUITS

3-5-1 LOGIC AND REG UNITS VOLTAGE LINES

Line	Description
PS 15V	The voltage from the DC power unit (CHASSIS; EP1).
VCC1	The same voltage as the PS 15V line which is controlled by the power switch.
M9V	Common 9 V for converted from the VCC1 line by the M9V regulator circuit (REG unit; IC1, Q8, Q9). The voltage is applied to the TX and RX units.
L9V	Common 9 V converted from the VCC1 line by the L9V regulator circuit (REG unit; IC2).
A5V	Common 5 V converted from the L9V line by the A5V regulator circuit (REG unit; IC3).
L5V	Common 5 V converted from the L9V line by the L5V regulator circuit (LOGIC unit; IC38, Q48, D43).
C5V	Common 5 V converted from the L9V line by the C5V regulator circuit (LOGIC unit; IC38, Q45, D13).
TEL5V	Common 5 V converted from the M9V line by the TEL5V regulator circuit (LOGIC unit; IC11).

3-5-2 RX UNIT VOLTAGE LINES

Line	Description
+5V	Common 5 V converted from the M9V line by the +5V regulator circuit (RX unit; IC3).
+6V	Common 6 V converted from the M9V line by the +6V regulator circuit (RX unit; IC7).
R5V	Receive 5 V converted from the R9V line by the R5V regulator circuit (RX unit; IC6).
R9V	Receive 9 V controlled by the R9V regulator circuit (RX unit; Q15) using "R9C" signal from IC39 (LOGIC unit).
V9V	Common 9 V converted from the M9V line by the V9V regulator circuit (RX unit; Q24).

3-5-3 TX UNIT VOLTAGE LINES

Line	Description
T5V	Transmit 5 V converted from the M9V line by the T5V regulator circuit (TX unit; IC1).
T6V	Transmit 6 V converted from the M9V line by the T6V regulator circuit (TX unit; IC4).
V9V	Common 9 V converted from the M9V line by the V9V regulator circuit (TX unit; Q6).

3-6 PORT ALLOCATIONS

3-6-1 EXPANDER IC (LOGIC UNIT; IC39)

Pin number	Port name	Description
4	BASL	Outputs the control signal for "BASE" LED on the FRONT unit.
5	RMTL	Outputs the control signal for "REMOTE" LED on the FRONT unit.
6	BUSYL	Outputs the control signal for "BUSY" LED on the FRONT unit.
7	TXL	Outputs the control signal for "TX" LED on the FRONT unit.
12	D5C	Outputs the control signal for the D5V on the FRONT unit.
13	PROGL	Outputs the control signal for "P" LED on the FRONT unit.
14	DCL	Outputs the control signal for "DC" LED on the FRONT unit.

3-6-2 EXPANDER IC (LOGIC UNIT; IC40)

Pin number	Port name	Description
4	AFMUTE1	Outputs the speaker mute signal for the received AF.
5	AFMUTE2	Outputs the speaker mute signal for the received 2/5TONE and DTMF signals.
6	MICMUTE1	Outputs the MIC mute signal for the hand microphone.
7	MICMUTE2	Outputs the MIC mute signal for the REMOTE connector.
11	TELBMR	Outputs the pulse control signal for the telephone dialer IC
12	TELMUTE2	Outputs the MOD mute signal for AF signal from the telephone line.
13	TELMUTE1	Outputs the telephone mute signal for the received AF signal.
14	MICMUTE3	Outputs the MIC mute signal for the ACC connector.

3-6-3 EXPANDER IC (LOGIC UNIT; IC41)

Pin number	Port name	Description
5	R/BSW	Outputs the switch control signal for the received AF signal to the microphone amplifier.
6	W/NS	Outputs the control signal for narrow/wide bands.
7	R9C	Outputs the control signal for the +9V regulator on the RX unit.
12	M9C	Outputs the control signal for the M9V regulator on the Rx unit and TX unit.
13	OPT1	Output the detection signals whether optional boards are installed or not.
14	OPT3	

3-6-4 D/A CONVERTER IC (LOGIC UNIT; IC25)

Pin number	Port name	Description
6	DA2STB	Input port for the strobe signal.
7	SCK	Input port for the clock signal.
8	SDTO	Outputs the serial data to the CPU (LOGIC unit; IC33).
9	AFFTTI	Input port for the received AF signal.
10	AFATTO	Outputs the adjusted AF signal for the repeater output.
14	RVCON	Outputs the adjustment signal for the PLL reference frequency on the RX unit.
15	TUNE	Outputs the BPF tuning signal to the RX unit.

3-6-5 D/A CONVERTER IC (TX UNIT; IC5)

Pin number	Port name	Description
1	ETONE	Input port for the TONE signal from the ACC connector.
2	ETONEO	Outputs the adjusted external TONE signal.
3	TXAFO	Outputs the TX AF signal to the TX modulation.
4	TXAF	Input port for the AF signal.
6	DA1STB	Input port for the strobe signal.
7	SCK	Input port for the clock signal.
8	SDTO	Outputs the serial data signal to the CPU (LOGIC unit; IC33).
9	TONE	Input port for the TONE signal.
10	TONEO	Outputs the adjusted TONE signal.
11	PCON	Outputs the TX power control signal.
14	TVCON	Outputs the adjustment signal for the TX unit PLL reference frequency.
15	MODC	Outputs the control signal for modulation balance.
21	MIXO	Input port for the mixed signal with the external signal, TX AF signal and internal signals.
22	REFMOD	Outputs the adjustment signal for TONE balance.
23	MOD	Outputs the adjusted AF signal for the TX modulation.
24	MIXO	Input port for the mixed signal with the ETONE, TX AF and TONE signals.

3-6-6 CPU (LOGIC UNIT; IC33)

Pin number	Port name	Description
1	RPLSTB	Outputs the strobe signal for the PLL IC on the RX unit.
2	TPLSTB	Outputs the strobe signal for the PLL IC on the TX unit.
3	TUNLK	Input port for the unlock signal from the PLL IC on the TX unit.
4	TMUTE	Outputs the TX mute signal for the TX unit.
5	TMUTE2	Outputs the TX mute signal for the PA unit.
8	M_PTT	Input port for the PTT switch signal from the microphone.
9	SPMUTE	Input port for [SPMUTE] switch.
10	REMOTE	Input port for [REMOTE] switch.
11	R/B	Input port for [R/B] switch.
13	MBEEP	Outputs the BEEP signal for modulation.
15	MONI	Input port for [MONI] switch.
16	CHUP	Input port for [CHUP] switch.
17	CHDN	Input port for [CHDN] switch.
18	DISP	Input port for [DISP] switch.
19	PROG	Input port for [PROG] switch.
26	COAXSW	Outputs the antenna switching signal.
27	CWO	Outputs the CW signal for transmit.
28	KBEEP	Outputs the beep audio signals to the speaker.
29	M/SO	Outputs the master/slave switching signal.
30	M/SI	Input port for the master/slave switching signal.
33	E_PTT	Input port for the PTT signal form the REMOTE connector.
34	E_PT2	Input port for PTT signal from the ACC connector.
35-39	D0-D4	Input port for the memory channel control signal.
40	NDET	Input port for the noise signal from the FM IF IC (RX unit; IC2).
41	SW	Outputs the temperature or PLL lock voltage switching signal.
43	2/5T DTMFO	Outputs the 2/5TONE and DTMF signals.
44	CTDTO	Outputs the CTCSS/DTCS signals.
45	PSD	Input port for the detection signal from the REG unit.
46	FWSWR	Input port for FW SWR signal from the PA unit.

CPU-Continued

Pin number	Port name	Description
47	RVSWR	Input port for the RV SWR signal from the PA unit.
48	TEMP	Input port for the temperature signals of PA and REG units.
49	T/RLV	Input port for the VCO lock voltage to the TX and RX unit.
50	RSSI	Input port for the RSSI signal from the FM IF IC (RX unit; IC2).
51	25TI	Input port for the 2/5TONE signals.
52	DTCSI	Input port for the DTCS signal.
68	TEL-BUSY	Input port for the busy signal from the pulse tone dialer IC (LOGIC unit; IC47).
69	MCK	Outputs the serial clock signal for the EEPROM (LOGIC unit; IC37).
70	MDT	I/O port for the serial data signal from/to the EEPROM (LOGIC unit; IC37).
71	TELSTB	Outputs strobe signal for the pulse tone dialer IC (LOGIC unit; IC47).
72	HOOKC	Outputs the ON/OFF HOOK control signal for the telephone line.
73	RING	Input port for the ringer detecting signal from the telephone line.
74	SHIFT	Outputs the control signal for the clock shift circuit.
75	INT	Input port for the power supply detection signal.
76	TXDTO	Outputs the serial data signal to the ACC connector.
77	RXDTO	Input port for the serial data signal from the ACC connector.
78	DTSEL1	Outputs the control signal for the DTMF SW IC (LOGIC unit; IC50).
79	TXDT1	Outputs the clone data signal.
80	RXDT1	Input port for the clone data signal.
81	DTSEL2	Outputs the control signal for the DTMF SW IC (LOGIC unit; IC30).
82	DTSTD	Input port for the TONE detecting signal from the DTMF decoder IC (LOGIC unit; IC31).
85	DTMFD	Input port for the data decoding signal from the DTMF decoder IC (LOGIC unit; IC31).
86	DTACK	Outputs the clock signal for the DTMF decoder IC (LOGIC unit; IC31).
87	ONHOOK	Input port for the detection signal of the ON-HOOK signal.
88	IOE	Outputs the control signal for the port expander IC (LOGIC unit; IC39–IC41).

CPU-Continued

Pin number	Port name	Description
89	PE3STB	Outputs the strobe signal for the port expander IC (LOGIC unit; IC41).
90	PE2STB	Outputs the strobe signal for the port expander IC (LOGIC unit; IC40).
91	PE1STB	Outputs the strobe signal for the port expander IC (LOGIC unit; IC39).
95	D2STB	Outputs the strobe signal for the D/A converter IC (LOGIC unit; IC25).
96	D1STB	Outputs the strobe signal for the D/A converter IC (TX unit; IC5).
97	SDTO	Outputs the serial data signal for the PLL IC (RX unit; IC4, TX unit; IC2), dialer IC (LOGIC unit; IC47), port expander IC (LOGIC unit; IC39–IC41) and optional boards.
98	SCK	Outputs the clock signal for the PLL IC (RX unit; IC4, TX unit; IC2), dialer IC (LOGIC unit; IC47), port expander IC (LOGIC unit; IC39–IC41) and optional boards.
99	RUNLK	Input port for the unlock signal from the PLL IC (RX unit; IC4).
100	C/DSW	Outputs the control signal for the TX-TONE filter (LOGIC unit; IC4).

SECTION 4 ADJUSTMENT PROCEDURES

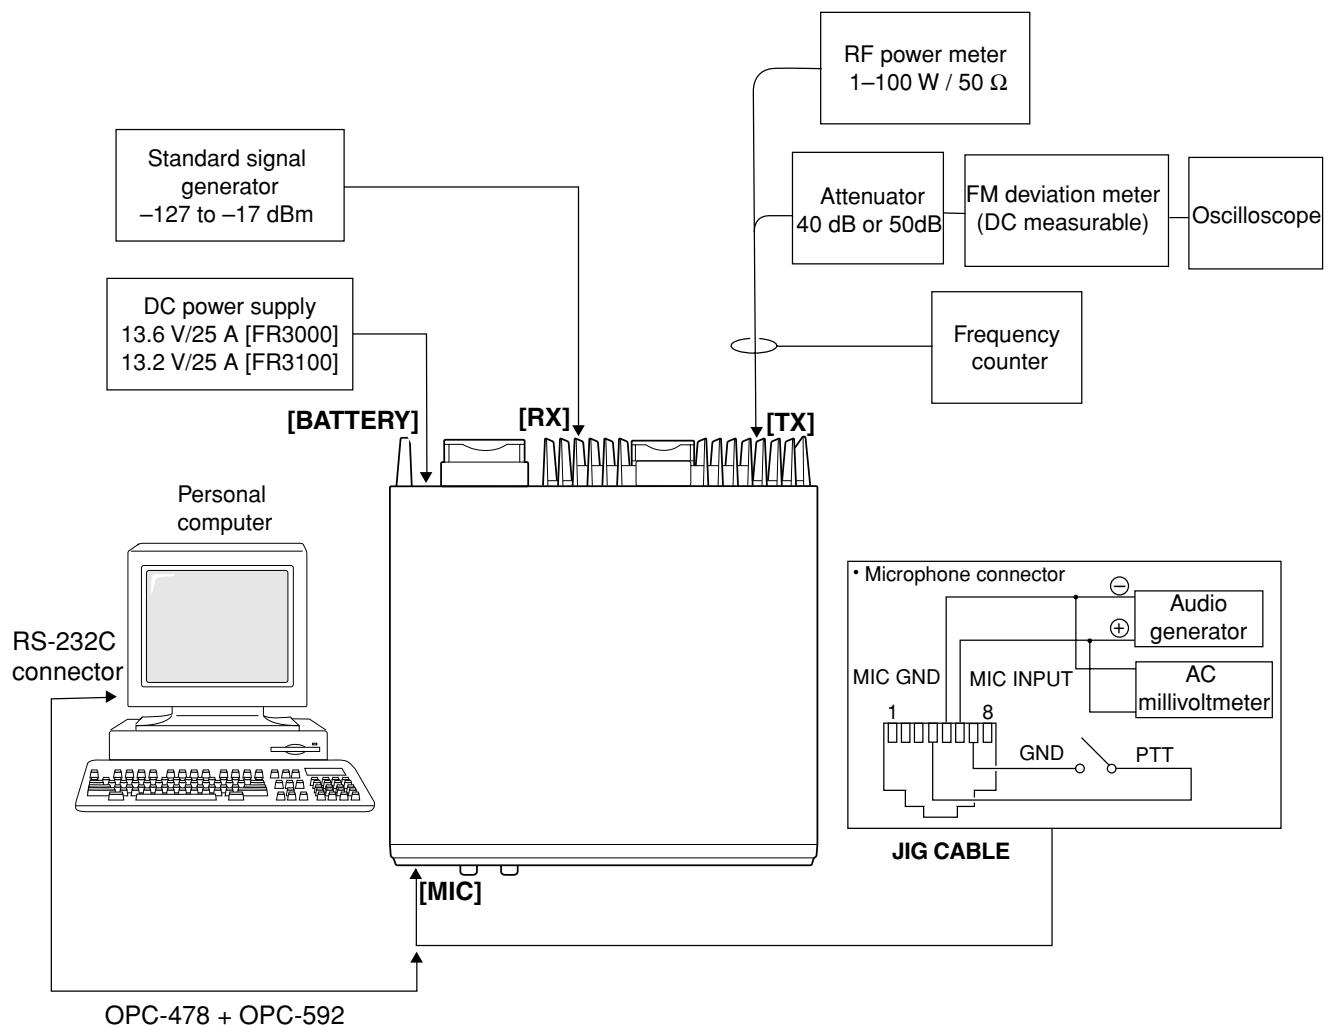

4-1 PREPARATION

Some adjustments must be performed on the "ADJUSTMENT MODE". CS-FR3000 CLONING SOFTWARE, OPC-478 CLONING CABLE and OPC-592 ADAPTOR CABLE are required when entering the adjustment mode. Refer to the next page in detail.

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 13.6 V DC [FR3000] 13.2 V DC [FR3100]	Audio generator	Frequency range : 300–3000 Hz Output level : 1–500 mV
	Current capacity : 25 A or more	Attenuator	Power attenuation : 40 or 50 dB Capacity : 100 W or more
RF power meter (terminated type)	Measuring range : 1–100 W	Standard signal generator (SSG)	Frequency range : 120–600 MHz Output level : 0.1 μ V–32 mV (–127 to –17 dBm)
	Frequency range : 100–300 MHz		AC millivoltmeter
Frequency counter	Impedance : 50 Ω	Oscilloscope	Frequency range : DC–20 MHz Measuring range : 0.01–20 V
	SWR : Less than 1.2 : 1		Digital multimeter
FM deviation meter	Frequency range : DC–600 MHz		
	Measuring range : 0 to \pm 5 kHz		

• CONNECTION

■ BEFORE ENTERING THE ADJUSTMENT MODE

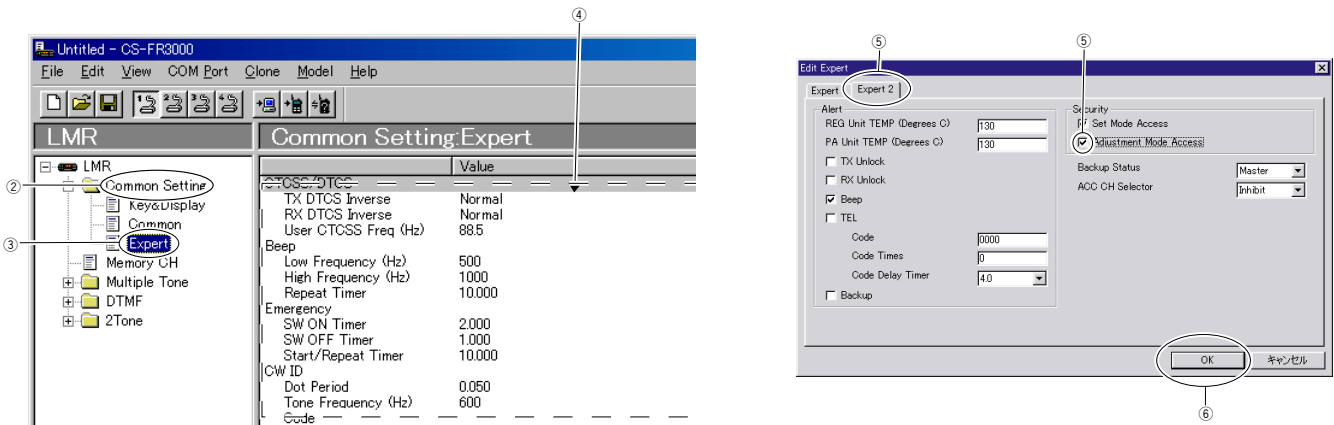

CAUTION!: Need to back up the original memory data using CS-FR3000 before cloning the adjustment frequencies.

When program the adjustment frequencies into the repeater, the repeater's memories channels will be overwritten the data and deleted original memory data at the same time.

Need to do cloning "Adjustment Mode Access" permitting and adjustment frequency into the CPU using CS-FR3000 before entering the adjustment mode. Otherwise, the repeater can not enter the adjustment mode.

■ PROCESS TO THE PERMIT "ADJUSTMENT MODE ACCESS"

- ① Run the CS-FR3000 CLONING SOFTWARE.
- ② Open the "Common Setting" folder .
- ③ Click the "Expert" card on the tree view window.
- ④ Double-click somewhere on the Common setting screen window, then appear the "Edit Expert" window.
- ⑤ Click the "Expert 2" tab, then click the "Adjustment Mode Access" check box.
- ⑥ Click "OK" button.
- ⑦ Click the "Memory CH" card on the tree view window.
- ⑧ Input adjustment frequencies as following page 4-4.
- ⑨ Cloning to the repeater then the repeater can be enter the adjustment mode.
Show the next page to enter the adjustment mode.

MEMORY CHANNEL SCREEN (Sample only)

CH	CH Attr	CH Inhibit	Rx Frequency	Tx Frequency	Tx Inhibit	RX C.Tone	TX C.Tc
1	A	OFF	173.92500	173.72500	OFF	OFF	<-----
2		OFF	173.92500	173.72500	OFF	OFF	<-----
3		OFF	162.07500	162.27500	OFF	OFF	<-----
4		OFF	150.07500	150.27500	OFF	OFF	<-----
5		OFF	150.07500	150.27500	OFF	OFF	<-----
6		OFF	162.07500	162.27500	OFF	OFF	<-----
7		OFF	162.07500	162.27500	OFF	OFF	<-----

9		OFF	173.92500	173.72500	OFF	OFF	<-----
10		OFF	162.07500	162.27500	OFF	OFF	<-----
11		OFF	162.07500	162.27500	OFF	OFF	<-----
12		OFF	162.07500	162.27500	OFF	OFF	<-----
13		OFF	160.27500	165.27500	OFF	OFF	<-----
14		OFF	160.27500	165.27500	OFF	OFF	<-----
15		OFF	160.27500	165.27500	OFF	OFF	<-----

■ ENTERING THE ADJUSTMENT MODE

- ① Turn the power OFF.
- ② While pushing and holding both [CH-DN] and [CH-UP], turn ON. Never release [CH-DN] and [CH-UP] until 1 short beep sounds.
- ③ Push [CH-DN] button, then sounds 2 beep audio.

■ OPERATING IN THE ADJUSTMENT MODE

- Change the item (including frequency) (+1). : Push [CH-UP] button.
 - Change the item (including frequency) (-1). : Push [CH-DN] button.
 - Adjust the specified value (+1). : Push [PRT/BASE] button.
 - Adjust the specified value (-1). : Push [MONI] button.
 - Change the TX and RX's condition. : Push [PROG] button.
- Change the condition TX reference frequency to RX reference frequency.
Change the condition TX "HIGH POWER" to TX "LOW POWER".

■ EXITING THE ADJUSTMENT MODE

- ① Turn the power OFF.
- ② While pushing and holding and [CH-UP], turn ON. Never release [CH-UP] until 1 short beep sounds.
- ③ Push [CH-UP] button, then sounds 2 beep audio.

■ AFTER FINISHING ADJUSTMENT

CAUTION!: When the adjustment is finished, the repeater need to be canceled adjustment mode.
Otherwise the repeater does not work properly.

- ① Perform the step ① to ④, described in the PROCESS TO PERMIT "ADJUSTMENT MODE ACCESS" (see page 4-2).
- ② Click the "EXPERT 2" tag, then clear the check box for the "Adjustment Mode Access".
- ③ Click "OK" button, then cloning with the original memory data.

SECTION 6 OPTION UNIT INSTALLATION

6-1 Opening the repeater's case

Follow the case and cover opening procedures shown here when an optional unit is installed or adjust the internal units, etc.

CAUTION: DISCONNECT the AC power cable and/or DC power cable from the repeater. Otherwise, there is danger of electric shock and/or equipment damage.

- ① Remove 6 screws from the top of the repeater and 4 screws from the sides, then lift up the top cover.
- ② Turn the repeater upside down.
- ③ Remove 6 screws from the bottom of the repeater, and 4 screws from the sides, then lift up the bottom cover.

6-2 Voice scrambler unit installation

The UT-109 (#01)/UT-110 (#01) provides high performance private communication for base operating mode. In order to receive or send scrambled transmissions, the UT-109 (#01)/UT-110 (#01) must be installed and to activate the scrambler function.

- ① Remove the top and bottom covers as shown above.
- ② Remove 8 screws from the LOGIC shielding plate, then remove the plate.

- ③ Cut the pattern on the PCB at the RX AF circuit (CP1) and TX mic circuit (CP2) on the LOGIC unit as shown at right.

- ④ Turn the repeater upside down, then install the scrambler unit as shown below.

- ⑤ Return the LOGIC shielding plate, top and bottom covers to their original positions.

6-3 Duplexer and isolater installation

- ① Remove the top and bottom covers (See page 6-1).
- ② Tighten 4 screws, (A), for installing the duplexer unit.
- ③ Tighten 4 screws, (B), for installing the isolater unit.

BOTTOM VIEW OF THE REPEATER

- ④ Cut the RX ANT-RX unit cable and then modify it.
- ⑤ Connect the modified cable to the duplexer unit (RX frequency connector)

BOTTOM VIEW OF THE REPEATER

- ⑥ Unplug the TX ANT-PA unit cable from the TX ANT connector (CHASSIS), and then plug to the isolater (input connector).

BOTTOM VIEW OF THE REPEATER

- ⑦ Connect the *cable between the isolater (output connector) and the duplexer (TX frequency connector).
- ⑧ Connect the *cable between the duplexer (ANT connector) and the TX ANT connector (CHASSIS).
- ⑨ Return the top and bottom cover to their original position.

BOTTOM VIEW OF THE REPEATER

***NOTE:** Connection cable are not supply with the isolater and the duplexer. Therefore, need to make them by yourself.
